Supplemental Figure 1. Dye-Filling Phenotype of BBSome Mutants

(A) BBSome mutants other than \textit{bbs-5} are dye-filling defective indicating defects in cilia structural integrity.  (B) IFT but not hyperactive secretion \textit{tom-1}, mutants are dye-filling defective.  (C) Mutations that suppress the enhanced secretion of dense-core vesicle of \textit{bbs-7} mutants: Rab27\textit{aex-6}, \textit{rabphilin/rbf-1} do not suppress the dye-filling defect of \textit{bbs-7} mutant.
