Supplemental Figure 3. BBsome Mutants have Normal Expression of Neuropeptide Genes

(A) Representative images of GFP expressed from the ADL specific srh-220 promoter and (B) corresponding quantitations with standard error are shown. (ns = not significant). (C) Expression of various neuropeptide genes in BBsome, tomosyn and IFT mutants were quantified by RT-PCR. Expression was normalized to actin, act-1. Expression in the mutants were not statistically different from wild type except for flp-21 in bbs-5 mutant.
