A  Duplicated genes are less abundant than their non-duplicated orthologs

Schrimpf et al., Figure S6

**Figure S6**
Expression levels of duplicated genes. Genes were classified as duplicated when an orthologous group contained more than one gene in one lineage, but only a single gene in the other lineage. Abundances of duplicated genes were either plotted separately (A), or pooled for each group (B). Columns marked with asterisks (***) are significantly different (p-value better than 1e-15).
