

S1 Fig

S1 Fig. Gene expression levels of RORB in the retina and spinal cord. Gene expression was measured through quantitative RT-qPCR of two amplicons in three rabbit individuals, one per genotype: wild-type (+/+), heterozygote (+/s^{am}) and sauteur (s^{am}/s^{am}). The y-axes indicate a relative measure of expression of each amplicon controlled for the expression of a housekeeping gene (*GAPDH*). Main bars indicate average relative expression, and error bars indicate the minimum and maximum values of three technical replicates for each tissue/individual.
