Figure S5. Hazard ratios for all-cause mortality after adjustment for additional potential confounders in the FINRISK cohort.

Hazard ratios for all-cause mortality per 1-SD biomarker concentration with additional adjustment for environmental factors, potential confounders and medication status in the FINRISK cohort. All models were adjusted for age, sex, body mass index, systolic blood pressure, fasting time, total cholesterol, HDL cholesterol, triglycerides, creatinine, smoking, alcohol consumption, prevalent diabetes, prevalent cardiovascular disease, and prevalent cancer. Error bars indicate 95% confidence intervals. Household income, leisure time physical activity index and medication status were assessed from questionnaires.
