Fexnidazole: 28-Day Oral Toxicity Study in the Rat

Product Name : Fexnidazole
Study Number: 0504-2007
Study Director/Author:
Sponsor Reference Study No.: Not applicable
Status: Final

SUMMARY

Methods

Fexnidaxole, a 5-nitroimidazole derivative biologically active against Trypanosoma parasites (*T.b. rhodesiense* and *T.b. brucei*), was administered orally by gavage once daily for 28 consecutive days to ten or fifteen Crl:CD (SD)IGS BR rats/sex/group at doses of 50, 200 and 800 mg/kg/day in a volume of 10 mL/kg.

A control group received the vehicle alone (5% Tween 80 in 0.5% Methyl cellulose 400 cP (Methocel) suspension).

Ten animals/sex/group were sacrificed at the end of the treatment period on Day 29 or 30 of study. The remaining 5 animals/sex in the control and high-dose groups were sacrificed on Day 43 at the end of a two-week observation period.

Mortality, behavior and general condition were observed daily. Body weight was recorded pretest, and on Days 1, 8, 14, 21, 28, 35 and 42. Food consumption was recorded from Days 1 to 8, 8 to 14, 14 to 21, 21 to 28, 29 to 35 and 35 to 42. Ophthalmoscopy was performed pre-test, and on Days 28 and 42. Hematological and clinical chemistry examinations and urine analysis were performed on Days 29 and 43.

Post-mortem examinations performed at the end of the treatment period (Day 29 or 30) or the recovery period (Day 43) included necropsy, organ weights and histological examination.

Systemic exposure information was obtained from three additional animals/sex/group on Days 1 and 14 at different time-points up to 24 hours after treatment and on Day 28 at different time-points up to 72 hours after treatment.

Results

No compound-related mortality occurred in any group.

No meaningful clinical signs or changes in ophthalmoscopic examinations were seen.

A minimal to slight, dose-dependent reduction in mean body weight was seen in male animals at 200 and 800 mg/kg for the entire treatment period. When treatment was discontinued a tendency to recover was seen, but values did not reach those of the controls. No meaningful changes in body weight were seen in female animals during the treatment period. During the recovery period high-dose females showed a minimally reduced body weight gain in comparison with controls.

Fexnidazole
Study Report for NervianoMS Study 0504-2007

0504-2007-R

A dose-dependent, minimal to slight decrease in food consumption was seen in male animals at 200 and 800 mg/kg. An almost complete recovery occurred on Day 42 of study. No meaningful changes in food consumption were seen in female animals.

At hematology, clinical chemistry and urinalysis no clear treatment-related changes were recorded during the study.

At gross and histopathological examination, the most significant changes, which were considered a direct effect of the treatment indicative of adaptation, were observed in the liver at all doses with some dose-relationship. On gross examination the liver from females showed increases in mean absolute and relative weights, which were minimal at the doses of 50 and 200 mg/kg/day and more prominent and statistically significant in animals receiving 800 mg/kg/day. Minimal to slight hypertrophy (increase in cell size) of the centrilobular hepatocytes was observed histologically in almost all animals of both sexes, at all doses with scant dose-relationship, correlating in females with the liver weight increases. After recovery the weight increases regressed completely at the dose of 800 mg/kg/day and the hepatocellular hypertrophy showed partial significant regression in terms of both incidence and severity in both sexes.

After the first and repeated dosing Fexnidazole was extensively metabolized to the sulfone and sulfoxide derivatives.

After the first and repeated administrations of the three dose levels, Cmax and AUCs of Fexnidazole were two to three times higher in females than in males. No relevant gender difference was detected for metabolites on Day 1, except at the low dose of 50 mg/kg. On Days 14 and 28 no relevant gender difference was detected for the sulfone metabolite while Cmax and AUCs of the sulfoxide metabolite were two to three times higher in females than in males.

On Days 1, 14 and 28, in both genders, AUCs of Fexnidazole and its metabolites increased with the dose administered.

Day 1 and Day 28 mean \pm SD systemic exposure to Fexnidazole is reported in the following table.

| Doses of Fexnidazole (mg/kg/day) | Day 1 | | Day 28 | |

Conclusions

Fexinidaxole, given orally once daily for 28 consecutive days at doses of 50, 200 or 800 mg/kg/day to Crl:CD (SD)IGS BR rats, was well tolerated at all doses tested, inducing only minimal to slight decreases in body weight and food consumption in male animals at 200 and 800 mg/kg. The minimal to moderate changes observed in the liver of all fexinidaxole-treated animals (increased liver weight and/or hypertrophy of the centrilobular hepatocytes) were restricted to dosing period and were considered of adaptative origin. Based on these results the dose of 200 mg/kg was considered the NOAEL. This dose corresponds on Day 28 to a mean AUC₀₋₂₄ of fexinidazole of 3173 or 7640 ng·h/mL in males and females respectively, a mean AUC₀₋₂₄ of sulfoxide metabolite of 129733 or 291500 ng·h/mL in males and females respectively, and a mean AUC₀₋₂₄ of sulfone metabolite of 459000 or 571500 ng·h/mL in males and females respectively.

1. INTRODUCTION AND OBJECTIVES

The purpose of this study (0504-2007) was to determine the potential toxicity of and systemic exposure to Fexinidazole when administered orally, by gavage, once a day for 28 consecutive days to Crl:CD (SD)IGS BR rats. Reversal of possible toxic effects was determined for control and high dose animals over a 2-week observation period. Systemic exposure information was obtained from animals that are similarly dosed for 28 consecutive days and were designated for the systemic exposure phase of the study.

Fexinidazole is a 5-nitroimidazole derivate, biologically active against Trypanosoma parasites (*T.b.rhodesiense* and *T.b. brucei*) and useful in the treatment of the Human African Trypanosomiasis (HAT), known as sleeping sickness.

4. REGULATORY REQUIREMENTS

This study was conducted in compliance with:

- Decreto Legislativo 2 Marzo 2007, No. 50;
- Organisation for Economic Co-operation and Development (OECD) Principles of Good Laboratory Practice (GLP) (as revised in 1997).

The methods employed in this study were those described in the "Standard Operating Procedures" of the laboratories involved.

| Storage Conditions | Room Temperature | |
| Expiry | Tween 80 | February 2011 |
| | Methyl cellulose 400 cP | -1st: January 2009 -2nd: January 2010 |
| | Water for injection | -1st: July 2010 -2nd: November 2010 |
| Source and Manufacturer | Tween 80 | Sigma-Aldrich |
| | Methyl cellulose 400 cP | Sigma-Aldrich |
| | Water for injection | Bieffe Medical |
| Method of Preparation | On file at Accelera/Experimental ADMET/Preclinical Formulation | |

6.1.3. Test Formulation

| | |
|--------------------------|---|
| Type of Formulation | 5% Tween 80 in 0.5% Methyl cellulose 400 cP (Methocel) suspension |
| Method of Preparation | On file at Accelera/Experimental AMDET/Preclinical Formulation |
| Frequency of Preparation | The solution was prepared according to the stability data |
| Dose Concentrations | 5, 20 and 80 mg/mL |
| Storage Conditions | Room temperature |
| Source and Manufacturer | Accelera/ Experimental AMDET/Preclinical Formulation |

6.1.4. Test Formulation Analyses

6.1.4.1. Homogeneity and Concentration

Samples (top-middle-bottom, 5 mL each) of each dose suspension prepared for the first and the last week of treatment (week 1 and 4) were collected under stirring for fexnidazole concentration and homogeneity checks; 10 mL were taken also from the vehicle. After collection, samples were directly transferred at room temperature to Accelera/DMPK & ART/Bioanalysis and Analytical Control for analysis. The analyses were performed using a validated HPLC-UV method (NervianoMS report 0293-2007-R).

Values were found to be within acceptable limits ($\pm 10\%$) according to the internal SOPs of Accelera - Nerviano Medical Sciences.

6.1.4.2. Stability

Stability data indicated that Fexnidazole in 5% Tween 80 in 0.5% Methyl cellulose 400 cP (Methocel) suspension in the range 0.5-100 mg/mL is stable for 7 days at room temperature or for 14 days at +4°C (NervianoMS report 0293-2007-R).

6.2. Test System

| | |
|--------------------------------------|--|
| Species/Strain or Breed, Source, Sex | Sprague Dawley rats supplied by Charles River Laboratories, Italia S.p.A., Via Indipendenza 11, Calco (Italy). |
| Justification of Species/Sex | The rat has been used extensively in safety studies and a large amount of biological data is available. |
| Age | Approximately 6 weeks at the start of treatment |
| Weight | Males: range from 169.7 to 203.5 grams at pre-test Females: range from 160.9 to 189.2 grams at pre-test |
| Acclimation | At least 5 days |
| Selection Criteria | General condition and body weight |

6.2.1. Environmental Conditions

| | |
|---------|--|
| Caging | Makrolon, (42x26x15 cm). Animals were caged two or three/cage |
| Room | 108/B |
| Bedding | Saw dust 700/2000 supplied by L.G. Packing Wood, s.n.c., Condove (Italy) |

| | |
|-------------|--|
| Temperature | 21.5° C +/- 1.5° C; monitored |
| Humidity | 55% +/- 15; monitored |
| Air | Approximately twenty air changes per hour; monitored |
| Lighting | Approximate 12-hour light, 12-hour dark cycle. The lighting cycle could be interrupted for performance of protocol-defined activities. |
| Water | Municipal main, water available ad libitum |
| Diet | 4RF21 GLP pellets ad libitum, supplied by Mucedola |

Actual conditions were continuously monitored and recorded, and records were retained. Release of each lot of feed by the manufacturers was based on analysis of composite samples of each lot, which met specifications set by the manufacturers. Water was periodically analyzed for chemical and microbial impurities. No contaminants were identified in the food or water which were expected to interfere with the results or conclusions of this study.

All the above environmental conditions, as well as all the procedures adopted throughout the study for housing and handling the animals, were in strict compliance with EEC and Italian Guidelines for Laboratory Animal Welfare.

6.2.2. Allocation/Randomization

The animals were selected and distributed into experimental groups using random number tables (Fisher and Yates). The randomization was performed during the pretest period on February 1, 2008 for all animals.

One male animal (No. 2846) assigned to satellite study group for toxicokinetic purposes, found dead on Day 2 of study, was replaced with another one taken from the same arrival batch of animals, in order to maintain the number of three animals/sex/group for subsequent blood samplings. The animal maintained the number 2846.

6.3. Experimental Design

The study was performed according to the following experimental scheme:

| Test Group | Dose (mg/kg/day) | Volume (mL/kg/day) | Number of Animals/Group | | | | | |
|------------|--------------------------|--------------------|-------------------------|---------|----------|---------|---------------|---------|
| | | | Toxicology | | | | Toxicokinetic | |
| | | | Main Study | | Recovery | | | |
| | | | Males | Females | Males | Females | Males | Females |

Fexinidazole
Study Report for NervianoMS Study 0504-2007

0504-2007-R

Animals were treated orally, by gavage, daily for 28 consecutive days. At the end of treatment period all animals from groups 2 and 3 and the first ten animals in numerical order (survival permitting) from groups 1 and 4 were sacrificed; the remaining animals were allowed a two-week recovery period.

6.3.1. Identification

The animals were identified by numbered metal tags on the right ear and different nicks on the left ear. A color-coded cage card was affixed to each study animal's cage and indicated the study number, cage number, treatment start date, test article, animal number, sex and dose level.

| Test Group | Color Code | Animal Identification | | | | | |
|-----------------------|-----------------|-----------------------|-----------|-----------------------|-----------|----------------------------|-----------|
| | | Toxicology | | | | Toxicokinetic ^a | |
| | | Main Study | | Recovery ^a | | | |
| Males | Females | Males | Females | Males | Females | Males | Females |
| 1 | White | 2735-2744 | 2785-2794 | 2745-2749 | 2795-2799 | - | - |
| 2 | Yellow | 2750-2759 | 2800-2809 | - | - | - | - |
| 3 | Green | 2760-2769 | 2810-2819 | - | - | - | - |
| 4 | Red | 2770-2779 | 2820-2829 | 2780-2784 | 2830-2834 | - | - |

| 8 | Red - dashed | - | - | - | - | 2844-2846 | 2856-2858 |
| a Survival permitting | | | | | | | |

6.3.2. Dose Administration

| | |
|------------------|---|
| Method and Route | Os, gavage |
| Duration | 28 days |
| Frequency | Once daily, at approximately the same time |
| Volume | 10 mL/kg/day; Individual dose volumes were calculated based on the most recent body weight recorded |
| Rate | Not applicable |

6.3.3. Dose Justification

Doses were selected taking into account the results of previous repeated oral toxicity studies performed in the same species.

In a 7-day repeated toxicity study (NervianoMS Study 0339-2007) Fexinidazole given orally once daily at doses of 500, 1000 or 2000 mg/kg/day to CrI:CD (SD)IGS BR rats, was well

Nerviano Medical Sciences

Page 15 of 31

tolerated and did not cause meaningful toxicological changes at any dose tested, apart from a minimal to slight decrease in food consumption and minimal to slight changes in a few hematological parameters seen in both sexes at all doses tested.

In a 90-day repeated toxicity study (Hoechst Report 77.1238) Fexnidazole given orally once daily at the doses of 50, 200 and 800 mg/kg/day induced toxicological effects, albeit reversible, at the two highest doses of 200 and 800 mg/kg/day. At 800 mg/kg/day protracted impairment of body weight was seen even if associated with an increase in food consumption. At 200 and 800 mg/kg/day decreased erythrocyte counts and increases in bilirubin levels were seen. In addition, at 800 mg/kg/day an increase in reticulocyte count was also detected.

Evaluation of the pharmacokinetics after a 3-day oral administration to male Sprague Dawley rats (NMS Study No. 0513-2007) demonstrated that exposure did not increased significantly from 500 to 1000 mg/kg/day.

The oral route and daily administration schedule are those envisaged for clinical setting.

6.4. Clinical and physical examinations

| | |
|---------------------------------------|--|
| Survival and Moribundity Observations | At least once a day during the pre-test and test periods |
| Clinical Signs | Every day, at least one session/day |
| Unscheduled Observations | Upon evidence of changes in general appearance, overt signs of toxicity or evidence of moribundity |
| Body Weights | Once pretest and on Days 1, 8, 14, 21, 28, 35 and 42 |
| Food Consumption | For Day-intervals 1 to 8, 8 to 14, 14 to 21, 21 to 28, 29 to 35 and 35 to 42. |
| Ophthalmoscopy | Pre-test, then on Day 28 (end of treatment period) for groups 1, 2, 3 and 4 and Day 42 (end of recovery period) for groups 1 and 4 |

6.5. Clinical Pathology

6.5.1. Hematology

| | |
|----------------------|--|
| Collection Intervals | Day 29 (end of treatment period) for groups 1, 2, 3 and 4 and Day 43 (end of recovery period) for groups 1 and 4 |
| Number of Animals | The last five animals in numerical order, i.e., the third five of groups 1 and 4 and the second five of groups 2 and 3 |
| Collection Site | Retroorbital sinus plexus |
| Anesthesia | Isofluorane |
| Fasting Requirements | Overnight (about 16 hours) |
| Unscheduled Samples | No further determinations and/or sampling times were added |
| Target Blood Volume | 0.5 mL |
| Anticoagulant | 8% EDTA solution |

Hematology Parameters Evaluated

| | |
|---|---|
| Red Blood Cells | Mean Corpuscular Volume reticulocytes |
| Hemoglobin | Mean Corpuscular Hemoglobin Concentration reticulocytes |
| Hematocrit | Mean Corpuscular Hemoglobin reticulocytes |
| Mean Corpuscular Volume | Platelets |
| Mean Corpuscular Hemoglobin | Mean Platelet Volume |
| Mean Corpuscular Hemoglobin Concentration | Platelet Distribution Width |
| Red Cell Distribution Width | Platelet Hematocrit |
| Hemoglobin Distribution Width | White Blood Cells |
| Reticulocyte Count (absolute and percent) | Differential White Blood Cells (absolute and percent) |

6.5.2. Clinical Chemistry

| | |
|----------------------|--|
| Collection Intervals | Day 29 (end of treatment period) for groups 1, 2, 3 and 4 and Day 43 (end of recovery period) for groups 1 and 4 |
| Number of Animals | The last five animals in numerical order, i.e., the third five of groups 1 and 4 and the second five of groups 2 and 3 |
| Collection Site | Retroorbital sinus plexus |
| Anesthesia | Isofluorane |
| Fasting Requirements | Overnight (about 16 hours) |
| Unscheduled Samples | No further determinations and/or sampling times were added |
| Target Blood Volume | 1 mL in tube for serum separation |
| Anticoagulant | None |

Clinical Chemistry Parameters Evaluated

| | |
|----------------------------|-------------------------------------|
| Urea | Albumin/Globulin Ratio (calculated) |
| Creatinine | Glucose |
| Alanine Aminotransferase | Triglycerides |
| Aspartate Aminotransferase | Total Cholesterol |
| Alkaline Phosphatase | Calcium |
| Gamma-glutamyltransferase | Phosphorus |
| Total Bilirubin | Sodium |
| Total Proteins | Potassium |
| Albumin | Chloride |
| Globulin | |

6.5.3. Urine Analysis

| | |
|-----------------------|--|
| Collection Intervals | Day 29 (end of treatment period) for groups 1, 2, 3 and 4 and Day 43 (end of recovery period) for groups 1 and 4 |
| Number of Animals | The last five animals in numerical order, i.e., the third five of groups 1 and 4 and the second five of groups 2 and 3 |
| Method of Collection | Metabolism cages. Before urine collection about 10 mL/kg of water were administered by gavage to each animal. |
| Sample Requirements | 1% Thimerosal (0,2 ml) in each bottle, before collection |
| Fasting Requirements | Overnight (about 16 hours) |
| Unscheduled Samplings | No further determinations and/or sampling times were added |

Urine Parameters Evaluated

| Urinalysis Parameters | Macroscopic appearance (description) |
|------------------------------|--------------------------------------|
| pH | Ketones |
| White Blood Cells | Urobilinogen |
| Nitrites | Bilirubin |
| Proteins | Hemoglobin/Red Blood Cells |
| Glucose | Specific gravity |

6.6. Postmortem Examinations**6.6.1. Unscheduled Deaths**

Female No 2824 treated with 800 mg/kg/day, found dead on Day 14 of study, was necropsied at the earliest possible time. Tissues listed in Section 6.6.2 were collected from this animal and examined microscopically.

6.6.2. Scheduled Necropsy, Tissue Collection, and Tissue Examination

| | |
|---|--|
| Sacrifice Schedule | Day 29 or 30 (end of treatment period) and Day 43 (end of recovery period). Animals with scheduled sacrifice on Day 30 were treated for an additional day to allow histopathological investigations about 24 hours after the last treatment. |
| Number of Animals (survival permitting) | Day 29: the second 5 animals/sex group in numerical order Day 30: the first 5 animals/sex group in numerical order Day 43: the last five animals/sex for groups 1 and 4. |
| Method of Euthanasia | Sodium thiopental i.p. and abdominal exsanguination |
| Fasting Requirements | Overnight (about 16 hours) |
| Terminal Body Weight | All animals |
| Macroscopic Examination | All animals |

Organs/tissues from animals surviving at the end of the treatment period or recovery period were collected and examined microscopically (E) according to the following table. Paired organs were weighed together. Relative organ weights were calculated using the terminal fasted body weight of each animal.

| Organ/Tissue | Main study and Recovery animals | | Examined (mg/kg/day) Main study animals | | | |
|--------------------------------|---------------------------------|---------|--|----|-----|-----|

| Organ/Tissue | Main study and Recovery animals | | Examined (mg/kg/day) Main study animals | | | |
|---|---------------------------------|---------|--|----|-----|-----|
| | Collected | Weighed | 0 | 50 | 200 | 800 |
| Histological examination was performed on all tissues/organs from the high-dose female found dead and from rats of the control and high dose group killed at the end of the treatment period. Examination of the liver and Harderian glands was extended to the other dose-groups for terminally killed animals and to all groups for animals killed after recovery. | | | | | | |
| <ul style="list-style-type: none"> a Except from animals found dead b Parathyroid glands examined microscopically if included in the section of thyroid glands c Samples from brain and liver were frozen in liquid nitrogen and kept at -80°C for further possible analysis <p>Fixatives:</p> <p>Bone Marrow Smears: Methanol-ether</p> <p>All Other Tissues: 10% neutral buffered formalin</p> | | | | | | |

Toxicokinetic study animals found dead were subjected to necropsy for the purpose of determining a possible cause of death; however, tissues were not collected from these animals.

6.6.3. Tissue Preparation

Histological sections of all tissues listed in 6.6.2 were trimmed, embedded, sectioned, and stained with hematoxylin and erythrosine (further stains if needed). Bone marrow smears were prepared and stained with May Grünwald-Giemsa.

All organs/tissues were kept for any further test necessary.

6.6.4. Pathology Peer Review

A pathology peer review was conducted by Paola Della Torre. The signed Peer Review Report was archived with study raw data.

6.7. Systemic Exposure

The toxicokinetics of Fexinidazole and its metabolites M1 (sulfoxide) and M2 (sulfone) were evaluated in accordance with the collection schedule and procedures tabulated below. The bioanalysis was conducted by Accelerate/DMPK & ART/Bioanalysis and Analytical Control.

| | |
|------------------------|---|
| Dose Levels (Groups) | Groups 5, 6, 7 and 8 |
| Collection Intervals | Days 1, 14 and 28 |
| Collection Time Points | Days 1 and 14: Pre-dose, 30 minutes, 1, 2, 4, 8 and 24h after dosing Day 28: Pre-dose, 1, 2, 4, 8, 24, 48 and 72h after dosing |

| | |
|------------------------------|---|
| | For controls, samples were taken pre-dose and at a representative time-point (2 hours). |
| Animals/Time Point | All |
| Anesthesia | Isofluorane |
| Collection Volume per Sample | About 0.25 mL of blood/point. |
| Collection Site | Retroorbital sinus plexus |
| Sample Requirements | Blood was put in heparinized plastic tubes kept on an ice-water bath, then centrifuged (10 min, 1200g, +4°C). Two aliquots of about 50 µL of plasma were stored in a freezer at –80°C until analysis. |
| Disposition of Animals | Euthanized after final blood collection, without necropsy |

After blood collection, frozen plasma specimens were transferred in plastic boxes to Accelera/DMPK & ART/Bioanalysis and Analytical Control, Nerviano Medical Sciences. The samples were loaded according to Watson 6.4.0.04 (Thermo Fisher Scientific Waltham, MA, USA).

Plasma samples were analyzed for the quantitation of Fexinidazole and its two metabolites using a validated LC-MS-MS method by Accelera/DMPK & ART/Bioanalysis and Analytical Control group.

Toxicokinetic calculations were carried out by Accelera/Pharmacokinetics & Modeling/Pharmacokinetics group. Details of the analytical method and of calculation methods were included in the toxicokinetic final report (Appendix 11).

7. DATA ACQUISITION

Clinical observations, body weights, organ weights, gross necropsy observations, histopathologic findings, and dose administration documentation were directly entered into the Xybion Path/Tox System or were recorded on appropriate paper forms, and, if appropriate, later entered into the Xybion Path/Tox System. Clinical pathology data were processed according to Clinical Pathology Laboratories procedures.

8. STATISTICAL ANALYSIS

8.1. Variables

The following parameters were evaluated: body weights, clinical chemistry, hematology, urinalysis, organ weights, organ/terminal body weight ratios.

8.2. Methods

Dunnett's test, included in a customized Xybion package, was performed.

9. ARCHIVING

The original protocol, the protocol amendment, all raw data, supporting documents, and specimens produced at the Test Facility, and the final report with original signatures were filed in the Archives of Accelera, Nerviano Medical Sciences S.r.l., Nerviano (Italy) for the period of time agreed with the Sponsor (at least 3 years) after which the Sponsor will be contacted for instructions regarding dispatch or disposal of the material.

A copy of the protocol, the report with original signatures, a reserve sample and all relevant original documentation of the test item were filed by the Sponsor.

10. STUDY DEVIATIONS

The following deviations from protocol were recorded:

Paragraph 5.3 Test System

Animal body weight range at pre-test was 169.7-203.5 grams for males and 160.9-189.2 grams for females instead of 180-200 grams at the beginning of the study as stated in the protocol.

Paragraph 6.6.2 Scheduled Necropsy

On Day 29 of study the second five animals/sex/group in numerical order were sacrificed instead of the first five as stated in the protocol. On Day 30 the first 5 animals/sex/group in numerical order were sacrificed instead of the second 5 as stated in the protocol.

| | |

12. RESULTS

12.1. Clinical and Physical Examinations

12.1.1. Mortality

No treatment-related deaths occurred during the study.

One accidental death occurred in one female (No. 2824) treated with Fexinidazole 800 mg/kg on Day 14 of study as a consequence of a faulty gavage during the last treatment performed on Day 13 (see also gross pathology and histopathology sections).

12.1.2. Clinical Signs

No treatment-related symptoms were observed in male or female animals at any dose tested.

12.1.3. Ophthalmoscopic examination

Ophthalmoscopic examinations performed at the end of the treatment and recovery periods did not reveal toxicological findings.

12.1.4. Body Weight

A dose-dependent reduction in mean body weight gain related to the first day of treatment was seen in male animals at 200 and 800 mg/kg for the entire treatment period. The reduction on Day 28 of study was considered minimal at 200 mg/kg (-11.3%) and slight at 800 mg/kg (-22.1%). Mean body weight showed the same trend, reaching statistical significance at the high dose from Day 8 up to the end of treatment. During the recovery period (control and high dose group) a tendency to recover was seen in high-dose males, but values did not reach those of the controls. On Day 42 mean body weight gain of high dose males was slightly reduced in comparison with controls (-17%).

No meaningful toxicological changes in body weight were seen in female animals during the treatment period. During the recovery period (control and high dose group) high dose females showed a minimally reduced body weight gain in comparison with controls (-8% on Day 42).

12.1.5. Food Consumption

A dose-dependent minimal to slight decrease in food consumption was seen in male animals of all Fexinidazole-treated groups. At 50 mg/kg/day the decrease was statistically significant only on Day 28 of study while statistical significance was attained from Day 8 to Day 28 at 200 and 800 mg/kg. An almost complete recovery occurred on Day 42 of study.

No meaningful changes in food consumption were seen in female animals.

12.2. Clinical Pathology

12.2.1. Hematology

A few alterations were observed in some hematological parameters throughout the study, but no clear treatment-related changes were recorded.

Minimal (8%) decreases in hemoglobin and moderate (about 46%) decreases in neutrophils were recorded in high-dose females on Day 29. Recovery occurred on Day 43. At this last sampling time a minimal (1.2- to 1.5-fold) increase in lymphocytes and monocytes was observed in females.

12.2.2. Clinical Chemistry

A few alterations in clinical chemistry values were observed, but these were considered secondary and not directly related to the compound.

A minimal to slight decrease in alkaline phosphatase was detected in all treated groups, with dose-relationship on Day 29 (-23 to -36% of control values in males, -11 to -34% of control values in females). In addition, minimal (1.1 to 1.5) increases in globulins (+13%) and total cholesterol (+51%) were recorded in high-dose females, along with a moderate decrease (-50%) in triglycerides in high-dosed males. At the same sampling time, phosphorus was slightly to moderately (1.3- to 1.7-fold) increased in high-dose males Nos. 2781, 2782, 2783.

On Day 43 a complete recovery occurred in all values apart from alkaline phosphatase, which recovered only partially in high-dose males.

12.2.3. Urinalysis

No clear treatment-related changes were recorded throughout the study.

A slight increase in white blood cells was recorded in high-dose males on Day 29. Recovery occurred on Day 43.

12.3. Postmortem Examinations

12.3.1. Organ Weights

End of treatment (Days 29-30)

The liver of females showed treatment-related increases in mean absolute and relative weights which were minimal at the doses of 50 and 200 mg/kg/day and more prominent and statistically significant in animals receiving 800 mg/kg/day. The percentage variations in comparison with controls are set out in the following table.

| Doses (mg/kg/day) | LIVER | | | |
|----------------------|-------|------|---------|------|
| | Males | | Females | |
| | Abs. | Rel. | Abs. | Rel. |
| 50 | + 5 | + 10 | + 10 | + 8 |
| 200 | + 3 | + 13 | + 13 | +10 |
| 800 | + 6 | + 21 | + 36** | +38 |

(**) = Statistical significance at P = 0.01

End of recovery (Day 43)

The increases in liver weights regressed completely in females receiving 800 mg/kg/day.

Other variations in mean weights sometimes noted in treated animals killed at termination or after recovery were considered to reflect either the individual variability observed also in controls or, only in males, some body weight decreases.

12.3.2. Gross Pathology

Unscheduled death

No treatment-related changes were seen in the high-dose female No 2824 found dead on Day 14 as a consequence of a faulty gavage during the last treatment performed on Day 13 (see also histopathology sections).

The main findings noted in this animal were represented by fairly good general condition, instead of good as in controls, and by the presence of abnormal content in the pleural cavity, consisting of clear liquid and soft yellow material (probably residual compound) adherent to the diaphragm and lungs.

End of treatment (Day 29 or 30) and of recovery (Day 43)

No treatment-related changes were noted in male and female animals killed either at termination at all doses or after recovery at the dose of 800 mg/kg/day.

Some findings noted in single instances, mainly in the group killed at termination after receiving 200 mg/kg/day, were considered unrelated to the treatment as they are known to occur, also on the basis of our experience, in untreated rats of the same strain and similar age. These changes, which are recorded in the "individual animal report", were mainly represented by encrusted or alopecic areas in the skin of both sexes and by clear content in the pleural cavity from a single female.

12.3.3. Histopathology

Unscheduled death

No treatment-related changes were noted in the high-dose female No 2824 that died on Day 14 as a consequence of a faulty gavage performed on Day 13. The main findings in this animal, graded as slight to marked, were characterized by: acute pleuritis, with abundant exudate in the pleural cavity, involving the lungs, the diaphragm, the thymus, the pericardium and the tissues adjacent to the aorta; lymphoid depletion of the thymus, spleen, mesenteric and mandibular lymph nodes; porphyrin deposits in the Harderian glands (graded

as marked); acinar hypertrophy of both salivary glands. The pleuritis, which was considered indicative of faulty gavage, correlated with the clear liquid noted in the pleural cavity on gross examination.

The other changes were considered mainly due to stress.

End of treatment (Days 29 and 30)

Changes considered as a direct effect of the treatment occurred in the liver as follows.

Liver. Minimal to slight hypertrophy of the centrilobular hepatocytes in almost all animals of both sexes at all doses, with scant dose-relationship, correlating for females with some weight increases noted on gross examination.

End of recovery (Day 43)

The liver changes showed some regression in high-dose animals as follows.

Liver. Minimal hypertrophy of centrilobular hepatocytes in two out of five males and in one female.

The slightly more prominent porphyrin deposits noted in the Harderian gland from treated animals when compared with controls, either at termination at all doses without dose-relationship or after recovery, were considered minor indirect effects of the treatment probably mediated by stress. As well as by the lack of dose-relationship, this hypothesis is supported by the presence of more prominent porphyrin deposits than those noted in animals killed at termination, in the high-dose female that died accidentally as a result of faulty gavage on Day 14.

The unilateral changes (hemorrhage/adenitis) noted in the Harderian glands from treated animals receiving 50 and 200 mg/kg/day killed at termination and from control and high dose animals killed after recovery were considered related to the blood sampling from the retroorbital sinus. All other changes noted in treated animals killed at termination were considered related to spontaneous pathology because they occurred with similar incidence and severity as in controls or because they are known to occur in our experience in untreated animals of the same strain and similar age.

12.4. Systemic Exposure

Day 1

Mean \pm SD systemic exposure to Fexinidazole is reported in the following table

| Dose mg/kg | Male | | | Female | | |
|---------------|---------------|--------------|----------------------------|---------------|--------------|----------------------------|
| | Cmax ng/mL | tmax hour | AUC0-t(last) ng·hour/mL | Cmax ng/mL | tmax hour | AUC0-t(last) ng·hour/mL |
| | | | | | | |

Fexinidazole
Study Report for NervianoMS Study 0504-2007

0504-2007-R

| | | | | | | |
|-----|-----------|-----|------------|----------|-----|------------|
| 50 | 39±17 | 1±0 | 178±99 | 149±46 | 2±2 | 759±153 |
| 200 | 165±97 | 2±1 | 1120±708 | 604±211 | 2±2 | 3200±856 |
| 800 | 1478±1111 | 2±1 | 10000±2160 | 1483±200 | 2±1 | 15700±3610 |

At each dose, C_{max} and AUC_{0-t(last)} values were about three times higher in female than in male rats. In both genders, the maximal plasma concentrations of Fexinidazole were promptly achieved, on average within 2 hours post dosing. In both genders, AUC_{0-t(last)} values of Fexinidazole increased with the dose administered.

Mean ±SD systemic exposure to the sulfoxide metabolite is reported in the following table

| Dose mg/kg | Male | | | Female | | |
|---------------|---------------|--------------|--|---------------|--------------|--|
| | Cmax ng/mL | tmax hour | AUC _{0-t(last)} ng·hour/mL | Cmax ng/mL | tmax hour | AUC _{0-t(last)} ng·hour/mL |
| | 50 | 1503±413 | 2±1 | 7660±2380 | 3893 ±663 | 23200±5330 |
| 200 | 9987±2131 | 2±0 | 80500±4310 | 12800±1127 | 3±1 | 91400±19700 |
| 800 | 32833±4952 | 5±2 | 366000±113000 | 30633±2616 | 4±0 | 453000±84700 |

Mean ±SD systemic exposure to the sulfone metabolite is reported in the following table

| Dose mg/kg | Male | | | Female | | |
|---------------|---------------|--------------|--|---------------|--------------|--|
| | Cmax ng/mL | tmax hour | AUC _{0-t(last)} ng·hour/mL | Cmax ng/mL | tmax hour | AUC _{0-t(last)} ng·hour/mL |
| | 50 | 1417±393 | 7±2 | 16500±9760 | 4417±2410 | 55800±28100 |
| 200 | 8550±2309 | 8±0 | 119000±21900 | 10023±815 | 8±0 | 134000±10800 |
| 800 | 40300±1562 | 8±0 | 465000±264000 | 44833±20128 | 13±9 | 683000±241000 |

Apart from 50 mg/kg dose, no relevant gender difference in C_{max} and AUC_{0-t(last)} values of metabolites was observed. In both genders, t_{max} values of the sulfoxide metabolite were similar to the corresponding ones of the parent compound while t_{max} values of the sulfone metabolite were achieved at later times.

In both genders, the systemic exposure to the metabolites increased with the dose administered. The systemic exposure to the metabolites was much higher than that to the parent compound.

In male rats, the sulfoxide metabolite to parent AUC_{0-t(last)} ratios were, on average, 46, 107 and 37 after 50, 200 and 800 mg/kg, respectively; the corresponding values in females were 29, 30 and 28.

In male rats, the sulfone metabolite to parent AUC_{0-t(last)} ratios were, on average, 81, 172 and 46 after 50, 200 and 800 mg/kg, respectively; the corresponding values in females were 64, 40 and 39.

Repeated dosing

Day 14 and Day 28 mean ±SD systemic exposure to Fexinidazole is reported in the following table

| Dose mg/kg/day | Male | | | Female | | |
|-------------------|---------------|--------------|--|---------------|--------------|--|
| | Cmax ng/mL | tmax hour | AUC _{0-t(last)} ng·hour/mL | Cmax ng/mL | tmax hour | AUC _{0-t(last)} ng·hour/mL |
| | ng/mL | hour | ng·hour/mL | ng/mL | hour | ng·hour/mL |
| Day 14 | | | | | | |
| 50 | 62±19 | 2±2 | 345±125 | 300±91 | 2±1 | 1310±161 |
| 200 | 274±163 | 3±1 | 2010±1520 | 773±107 | 2±1 | 4030±215 |

Fexnidazole

| | | | 11900±5360 | | | 7940±2210 (2) |

(1) AUC within 24 hours post dosing

(2) n=2

At each dose, C_{max} and AUC_{0-t(last)} values were two to three times higher in female than in male rats. No relevant difference in the Fexnidazole levels was observed on Day 28 compared to Day 14. On Days 14 and 28, in both genders, the maximal plasma concentrations of Fexnidazole were achieved, on average, within 4 hours post dosing. On Day 28, in males, mean ±SD apparent terminal half-lives were 4.7 ±1.2, 8.8 ±4.8 and 11 ±2.7 hours after 50, 200 and 800 mg/kg/day, respectively. The corresponding female half-lives were 5.1 ±5.1, 6.3 ±4.5 and 6.7 ±2.3 (n=2) hours. In both genders, AUC_{0-t(last)} values of Fexnidazole increased with the dose.

Day 14 and Day 28 male AUC_{0-t(last)} (AUC within 24 hours post dosing on Day 28) accumulation ratios were, on average, 2.2 and 5.7 after 50 mg/kg/day, 1.6 and 2 after 200 mg/kg/day and 0.5 and 0.3 after 800 mg/kg/day, respectively. The corresponding values in females were 1.7 and 2, 1.3 and 1.5, 0.9 and 0.4.

Day 14 and Day 28 mean ±SD systemic exposure to the sulfoxide metabolite is reported in the following table

| Dose mg/kg/day | Male | | | Female | | |
|-------------------|---------------|--------------|--|---------------|--------------|--|
| | Cmax ng/mL | tmax hour | AUC _{0-t(last)} ng·hour/mL | Cmax ng/mL | tmax hour | AUC _{0-t(last)} ng·hour/mL |
| | Day 14 | | | | | |

| | | | 268000±64100 | | | 331000±57300(2) |

(1) AUC within 24 hours post dosing - (2) n=2

At each dose, the levels of the metabolite were about two to three times higher in the female than in the male rat. No relevant difference in the levels of the metabolite were observed on Day 28 compared to Day 14. In both genders, the maximal plasma concentrations of the sulfoxide metabolite were achieved, on average, 2 - 3 hours post dosing. On Day 28, mean ±SD male apparent terminal half-lives were 5 ±2, 6.3 ±2.9 and 6.6 ±4.1 hours after 50, 200 and 800 mg/kg/day, respectively, whilst the corresponding female half-lives were 6.1 ±3.8,

8.1 ± 3.1 and 8.6 ± 2.3 (n=2) hours. In both genders, the systemic exposure to the metabolite increased with the dose .

Day 14 and Day 28 male AUC_{0-t(last)} (AUC within 24 hours post dosing on Day 28) accumulation ratios were, on average, 1.6 and 3.9 after 50 mg/kg/day, 1.2 and 1.5 after 200 mg/kg/day and 0.5 and 0.4 after 800 mg/kg/day, respectively. The corresponding values in females were 2.1 and 2.5, 1.6 and 1.5, 0.8 and 0.6.

The systemic exposure to the metabolite was much higher than that to the parent compound.

Day 14 and Day 28 mean \pm SD systemic exposure to the sulfone metabolite is reported in the following table

| Dose mg/kg/day | Male | | | Female | | |
|-------------------|------------------|--------------|--|---------------------|--------------|---|
| | Cmax ng/mL | tmax hour | AUC _{0-t(last)} ng·hour/mL | Cmax ng/mL | tmax hour | AUC _{0-t(last)} ng·hour/mL |
| | Day 14 | | | | | |
| 50 | 4773 \pm 566 | 4 \pm 0 | 62800 \pm 11300 | 7980 \pm 2285 | 8 \pm 0 | 116000 \pm 24900 |

| 800 | 33000 \pm 6655 | 5 \pm 2 | 459000 \pm 60605 (1) 509000 \pm 94900 | 41900 \pm 2970(2) | 6 \pm 3(2) | 571500 \pm 54447(1,2) 738000 \pm 135000(2) |

(1) AUC within 24 hours post dosing - (2) n=2

At each dose, no relevant gender difference in C_{max} and AUC_{0-t(last)} values was observed. No relevant difference in the levels of the metabolite were observed on Day 28 compared to Day 14. T_{max} values of the metabolite were achieved at later times in comparison with the corresponding ones of the parent compound. On Day 28, mean male apparent terminal half-lives were 6.1 ± 1.2 , 7.5 ± 2.4 and 10 ± 3 hours after 50, 200 and 800 mg/kg/day, respectively, the corresponding half-lives in females were 13 ± 9.8 , 7.3 ± 2.6 and 11 ± 5.6 (n=2) hours. The systemic exposure to the metabolite increased with the dose.

Day 14 and Day 28 male AUC_{0-t(last)} (AUC within 24 hours post dosing on Day 28) accumulation ratios were, on average, 5.2 and 9.3 after 50 mg/kg/day, 2.3 and 2.9 after 200 mg/kg/day and 1.3 and 1.6 after 800 mg/kg/day, respectively. The corresponding values in females were 2.3 and 3.8, 2.3 and 2.6, 1 and 0.8.

The systemic exposure to the metabolite was much higher than that to the parent compound.

13. DISCUSSION

Fexinidazole was administered orally by gavage once daily for 28 consecutive days to ten or fifteen Crl:CD (SD)IGS BR rats/sex/group at doses of 50, 200 and 800 mg/kg/day in a volume of 10 mL/kg.

Fexinidazole was well tolerated at all doses tested. No drug-related deaths occurred and no meaningful clinical signs were seen during the study. In addition, at hematology, clinical chemistry and urinalysis no clear treatment-related changes were recorded during the study.

Minimal to slight signs of toxicity were restricted to a dose-dependent, minimal to slight, reduction in body weight seen in male animals at 200 and 800 mg/kg for the entire treatment period which was concomitant with a dose-dependent minimal to slight decrease in food consumption. When treatment was discontinued a tendency to recover was seen both for body weight and food consumption although values on Day 42 remained below the control values. No meaningful toxicological changes in body weight and food consumption were seen in female animals during treatment period.

A direct effect of the treatment, indicative of adaptation, was observed in the liver at all doses with some dose-relationship. On gross examination the liver from females showed increases in mean absolute and relative weights, which were minimal at the doses of 50 and 200 mg/kg/day and more prominent and statistically significant in animals receiving 800 mg/kg/day. Minimal to slight hypertrophy (increase in cell size) of the centrilobular hepatocytes was observed histologically in almost all animals of both sexes, at all doses with scant dose-relationship. This finding correlated with the liver weight increases in females. After recovery the weight increases regressed completely at the dose of 800 mg/kg/day and the hepatocellular hypertrophy showed partial significant regression in terms of both incidence and severity in both sexes. Hepatocellular hypertrophy, may be indicative of adaptation, which, in itself, is not necessarily adverse unless associated with other more severe changes (e.g. degeneration, necrosis and hyperplasia)⁽¹⁾.

After the first and repeated dosing in male and female rats Fexinidazole was extensively metabolized to the sulfone and sulfoxide derivatives.

On Days 1, 14 and 28, in both genders, AUCs of Fexinidazole and its metabolites increased with the dose administered.

After the first and repeated administrations of the three dose levels, Cmax and AUCs of Fexinidazole were two to three times higher in females than in males. No relevant gender differences were detected for metabolites on Day 1, except at the low dose of 50 mg/kg. On Days 14 and 28 no relevant gender differences were detected for the sulfone metabolite, while Cmax and AUCs of the sulfoxide metabolite were two to three times higher in females than in males. This may be indicative of a higher metabolic activity in females, with a consequent more marked increase in liver weight.

14. CONCLUSIONS

Fexinidazole, given orally once daily for 28 consecutive days at doses of 50, 200 or 800 mg/kg/day to Crl:CD (SD)IGS BR rats, was well tolerated at all doses tested inducing only minimal to slight decrease in body weight and food consumption in male animals at 200 and 800 mg/kg. The minimal to moderate changes observed in the liver of all fexinidazole-

Fexnidazole
Study Report for NervianoMS Study 0504-2007

0504-2007-R

treated animals (increased liver weight and/or hypertrophy of the centrilobular hepatocytes) were restricted to the dosing period and were considered of adaptative origin. Based on these results the dose of 200 mg/kg was considered the NOAEL. This dose on Day 28 corresponds to a mean AUC₀₋₂₄ of fexnidazole of 3173 or 7640 ng•h/mL in males and females, respectively, a mean AUC₀₋₂₄ of sulfoxide metabolite of 129733 or 291500 ng•h/mL in males and females, respectively, and a mean AUC₀₋₂₄ of sulfone metabolite of 459000 or 571500 ng•h/mL in males and females, respectively.

LUNG

pleuritis is mainly characterized by the presence of abundant inflammatory exudate in the pleural cavity, focally adherent to the pleura and with scant involvement of the lung parenchyma. These findings correlated with the abnormal contents, in particular with the clear liquid, noted on gross examination in the pleural cavity.

OPTIC NERVES No gross observations on tissue

ONLY ONE NERVE IS AVAILABLE FOR EXAMINATION, Present.

PLEURAL CAVITY ABNORMAL CONTENTS/ clear liquid and soft yellowish material adherent to the diaphragm and lungs.

Tissue is unremarkable.

for abnormal contents noted on gross examination see "lungs".

PARATHYROIDS No gross observations on tissue

ONLY ONE PARATHYROID AVAILABLE FOR EXAMINATION, Present.

MANDIBULAR S.G. No gross observations on tissue

ACINAR HYPERTROPHY, Slight, Diffuse.

PAROTIDS No gross observations on tissue

ACINAR HYPERTROPHY, Slight, Diffuse.

SPLEEN No gross observations on tissue

LYMPHOID DEPLETION, Moderate, Diffuse.

Fexinidazole
Toxicokinetic Report for the study No. 0504-2007

1. INTRODUCTION AND OBJECTIVE

Fexinidazole is a 5-nitroimidazole derivate under investigation for the treatment of the Human African Trypanosomiasis (HAT), known as sleeping sickness.

As part of a GLP toxicity study, the toxicokinetics of Fexinidazole and its sulfoxide and sulfone metabolites were evaluated after the first and repeated oral administrations of Fexinidazole to male and female Crl:CD (SD)IGS BR rats.

2. STUDY SPONSOR

4. REGULATORY REQUIREMENTS

This study will be GLP regulated and will be conducted in compliance with:

- DECRETO LEGISLATIVO 2 Marzo 2007, No. 50 and
- Organization for Economic Co-operation and Development (OECD) Principles of Good Laboratory Practice (GLP) (as revised in 1997).

5. ABBREVIATIONS

The following abbreviations are used in this document:

| | |
|--------------------------|--|
| AUC _{0-t(last)} | Area under the plasma concentration vs. time curve up to finite time |
| C _{max} | Maximal plasma concentration |
| CV | Coefficient of variation of the mean |
| F | Female |
| ID | Animal identification code |
| LC | Liquid chromatography |
| LLOQ | Lower limit of quantification |
| M | Male |
| MS | Mass-spectrometry |
| Norm | Normalized value |
| QC | Quality control sample |
| R ² | Correlation coefficient |
| RA | Accumulation ratio |

Fexinidazole
 Toxicokinetic Report for the study No. 0504-2007

| | |
|--------------------|-----------------------------------|
| SD | Standard deviation of the mean |
| STD | Standard sample |
| t _{1/2,z} | Terminal half-life |
| t _{max} | Time to peak plasma concentration |
| ULOQ | Upper limit of quantification |

6. METHODS

6.1. Study Design

The study was conducted according to the study protocol and related amendment [1, 2]. Fexinidazole was orally given by gavage once a day for 28 days to male and female Sprague Dawley rats according to the following scheme

| Dose (mg/kg/day) | Volume (mL/kg/day) | Rat ID |
|---------------------|-----------------------|----------------------------|
| 0 | 10 | M: 2835-2837; F: 2847-2849 |
| 50 | 10 | M: 2838-2840; F: 2850-2852 |
| 200 | 10 | M: 2841-2843; F: 2853-2855 |
| 800 | 10 | M: 2844-2846; F: 2856-2858 |

Fexinidazole was suspended with 5% Tween 80 in 0.5% Methyl cellulose 400 cP.

6.2. Sample Collection and Handling

Blood samples (about 0.25 mL/sampling time) were withdrawn from retro-orbital sinus plexus under isofluorane anesthesia and put in heparinized plastic tubes kept on a ice-water bath, then centrifuged for 10 min at 1200g at +4°C and two aliquots of about 50 µL of plasma were stored in a freezer at -80°C until analysis. Blood was taken from three rats/gender/dose on Days 1 and 14 at pre-dose and 0.5, 1, 2, 4, 8 and 24 hours after dosing, on Day 28 at pre-dose and 1, 2, 4, 8, 24, 48 and 72 hours after dosing. After the administration of the vehicle, the samples were taken from three rats/gender at pre-dose and 2 hours post dosing.

6.3. Bioanalytical Method

Rat plasma concentrations of Fexinidazole and its sulfoxide (M1) and sulfone (M2) metabolites were determined by a validated LC/MS/MS method [3,4]. The calibration range for the assay was 5-1000 ng/mL for Fexinidazole and 25-25000 ng/mL for M1 and M2. Study samples containing analytes concentrations above the upper limit of quantitation were diluted with blank matrix prior to analysis.

6.4. Pharmacokinetic Calculations

Pharmacokinetic evaluation was carried out using non-compartmental approach with the aid of the Watson package (v. 6.4.0.04, Thermo Fisher Scientific, Waltham, MA, USA) and Excel spreadsheet (Microsoft Inc., Seattle, USA).

Fexinidazole
Toxicokinetic Report for the study No. 0504-2007

In the calculations, the undetectable concentrations between detectable ones were ignored.

After each dose level, C_{max} and t_{max} of Fexinidazole and sulfoxide and sulfone metabolites were read from raw data as the coordinates of the highest measured concentration. The area under plasma concentration vs. time curve to finite time, $AUC_{0-t(last)}$, was determined by the linear trapezoidal rule up to the last detectable concentration. On Day 28, since the blood sampling was performed up to 72 hours post dosing, in addition to $AUC_{0-t(last)}$, AUC within 24 hours post dosing was calculated and denoted AUC_{0-24} . This AUC was calculated in order to compare AUC values on Day 28 to those on Day 1 and Day 14. On Day 28, in addition, the half-life of the terminal phase, $t_{1/2,z}$, was determined by linear regression analysis of the natural-log concentration vs. time curve, where $t_{1/2,z} = \ln(2)/\text{slope of the regression line}$.

After each dose, C_{max} and AUC values of each compound were also normalized to 1 mg/kg/day dose level.

Metabolite to parent ratio was calculated based on C_{max} and $AUC_{0-t(last)}$ values corrected for the molecular weight.

Fexinidazole and metabolites accumulation ratios, based on C_{max} (R_A, C_{max}), AUC_{0-24} (R_A, AUC_{0-24}) and $AUC_{0-t(last)}$ ($R_A, AUC_{0-t(last)}$), were calculated as the ratio between the parameters obtained on Day 14 and Day 28 to the corresponding one at Day 1.

Descriptive statistics (mean \pm SD, %CV) were reported for plasma concentrations and pharmacokinetic parameters of each compound sorted by dose, gender and day of dosing.

7. RESULTS

7.1. Tables and Figures

Mean C_{max} , t_{max} , AUC within 24 hours post dosing and $AUC_{0-t(last)}$ parameters of each compound are reported in Tables 1 and 2, whilst individual and mean parameters of each compound are reported in Tables 3 - 20. Individual and mean (\pm SD, CV%) plasma concentrations of Fexinidazole and sulfoxide and sulfone metabolites are reported in Tables 2A1 - 19A1 of Appendix 1. Individual plasma concentrations of Fexinidazole and both metabolites are plot in Figures 1 - 9, whilst the mean concentrations are plot in Figures 10 - 15. Mean normalized C_{max} and $AUC_{0-t(last)}$ values of Fexinidazole and metabolites vs. dose are plot in Figures 16 - 21.

In-study bioanalytical validation data are reported in Appendix 2. All analytical batches met acceptance criteria as described in PCD-M-BPK-001-01 SOP [5]. Bioanalytical data are stored in Watson LIMS (v. 6.4.0.04, Thermo Fisher Scientific, Waltham, MA, USA) under Project ID: 348-Fexinidazole and Study ID 0504-2007. Certificates of analysis are reported in Appendix 3.

7.2. Control Sample Analysis

One detectable concentrations of each compound was measured in the control samples. Analyses were rerun in duplicate and the results confirmed. The detectable concentration of Fexinidazole was 9.61 ng/mL, whilst those of sulfoxide and sulfone metabolites were 29.4

Fexinidazole
Toxicokinetic Report for the study No. 0504-2007

and 32.7 ng/mL, respectively (see Table 1A1 of Appendix 1). These values were close to the lower limit of quantification of the method for each compound. For this reason, the observed contaminations do not affect the conclusions drawn from the toxicokinetic analysis for this study.

7.3. Pharmacokinetic results

Day 1

Mean \pm SD systemic exposure to Fexinidazole is reported in the following table

| Dose mg/kg | Male | | | Female | | |
|---------------|---------------------------|--------------------------|--|---------------------------|--------------------------|--|
| | C _{max} ng/mL | t _{max} hour | AUC _{0-t(last)} ng·hour/mL | C _{max} ng/mL | t _{max} hour | AUC _{0-t(last)} ng·hour/mL |
| 50 | 39 \pm 17 | 1 \pm 0 | 178 \pm 99 | 149 \pm 46 | 2 \pm 2 | 759 \pm 153 |
| 200 | 165 \pm 97 | 2 \pm 1 | 1120 \pm 708 | 604 \pm 211 | 2 \pm 2 | 3200 \pm 856 |
| 800 | 1478 \pm 1111 | 2 \pm 1 | 10000 \pm 2160 | 1483 \pm 200 | 2 \pm 1 | 15700 \pm 3610 |

The male rat ID 2843 at 200 mg/kg showed levels of Fexinidazole about five times lower than those measured in the other two rats.

At each dose, C_{max} and AUC_{0-t(last)} values were about three times higher in female than in male rats. In both genders, the maximal plasma concentrations of Fexinidazole were promptly achieved, on average within 2 hours post dosing. In both genders, AUC_{0-t(last)} values of Fexinidazole increased with the dose administered (Figures 16 - 17).

Mean \pm SD systemic exposure to the sulfoxide metabolite is reported in the following table

| Dose mg/kg | Male | | | Female | | |
|---------------|---------------------------|--------------------------|--|---------------------------|--------------------------|--|
| | C _{max} ng/mL | t _{max} hour | AUC _{0-t(last)} ng·hour/mL | C _{max} ng/mL | t _{max} hour | AUC _{0-t(last)} ng·hour/mL |
| 50 | 1503 \pm 413 | 2 \pm 1 | 7660 \pm 2380 | 3893 \pm 663 | 3 \pm 1 | 23200 \pm 5330 |
| 200 | 9987 \pm 2131 | 2 \pm 0 | 80500 \pm 4310 | 12800 \pm 1127 | 3 \pm 1 | 91400 \pm 19700 |
| 800 | 32833 \pm 4952 | 5 \pm 2 | 366000 \pm 113000 | 30633 \pm 2616 | 4 \pm 0 | 453000 \pm 84700 |

Apart from 50 mg/kg dose, no relevant gender difference in C_{max} and AUC_{0-t(last)} values was observed. In both genders, t_{max} values of the metabolite were similar to the corresponding ones of the parent compound. In both genders, the systemic exposure to the metabolite increased roughly in direct proportion with the dose (Figures 18 - 19).

In the male rat, the metabolite to parent AUC_{0-t(last)} ratios were, on average, 46, 107 and 37 after 50, 200 and 800 mg/kg, respectively; the corresponding values in females were 29, 30 and 28. The systemic exposure to the metabolite was much higher than that to the parent compound.

Fexinidazole
 Toxicokinetic Report for the study No. 0504-2007

Mean \pm SD systemic exposure to the sulfone metabolite is reported in the following table

| Dose | Male | | | Female | | |
|-------|------------------|------------------|--------------------------|-------------------|------------------|--------------------------|
| | C _{max} | t _{max} | AUC _{0-t(last)} | C _{max} | t _{max} | AUC _{0-t(last)} |
| mg/kg | ng/mL | hour | ng·hour/mL | ng/mL | hour | ng·hour/mL |
| 50 | 1417 \pm 393 | 7 \pm 2 | 16500 \pm 9760 | 4417 \pm 2410 | 8 \pm 0 | 55800 \pm 28100 |
| 200 | 8550 \pm 2309 | 8 \pm 0 | 119000 \pm 21900 | 10023 \pm 815 | 8 \pm 0 | 134000 \pm 10800 |
| 800 | 40300 \pm 1562 | 8 \pm 0 | 465000 \pm 264000 | 44833 \pm 20128 | 13 \pm 9 | 683000 \pm 241000 |

Apart from 50 mg/kg dose, no relevant gender difference in C_{max} and AUC_{0-t(last)} values was observed. In both genders, t_{max} values of the metabolite were achieved at later times in comparison with the corresponding ones of the parent compound. The systemic exposure to the metabolite increased with the dose administered (Figures 20 - 21).

In the male rats, the metabolite to parent AUC_{0-t(last)} ratios were, on average, 81, 172 and 46 after 50, 200 and 800 mg/kg, respectively; the corresponding values in females were 64, 40 and 39. The systemic exposure to the metabolite was much higher than that to the parent compound.

Repeated dosing

Day 14 and Day 28 mean \pm SD systemic exposure to Fexinidazole is reported in the following table

| Dose | Male | | | Female | | |
|-----------|------------------|------------------|---|-----------------------------|--------------------------|--|
| | C _{max} | t _{max} | AUC _{0-t(last)} | C _{max} | t _{max} | AUC _{0-t(last)} |
| mg/kg/day | ng/mL | hour | ng·hour/mL | ng/mL | hour | ng·hour/mL |
| Day 14 | | | | | | |
| 50 | 62 \pm 19 | 2 \pm 2 | 345 \pm 125 | 300 \pm 91 | 2 \pm 1 | 1310 \pm 161 |
| 200 | 274 \pm 163 | 3 \pm 1 | 2010 \pm 1520 | 773 \pm 107 | 2 \pm 1 | 4030 \pm 215 |
| 800 | 565 \pm 106 | 3 \pm 1 | 5120 \pm 1540 | 1478 \pm 1115 | 3 \pm 4 | 13500 \pm 3620 |
| Day 28 | | | | | | |

⁽¹⁾ AUC within 24 hours post dosing

⁽²⁾ n=2

As for Day 1, the male rat ID 2843 treated at 200 mg/kg/day showed levels of Fexinidazole remarkably lower than those measured in the other two rats.

At each dose, C_{max} and AUC_{0-t(last)} values were two - three times higher in female than in male rats. No relevant difference in the Fexinidazole levels were observed on Day 28 compared to Day 14. On Days 14 and 28, in both genders, the maximal plasma concentrations of Fexinidazole were achieved, on average, within 4 hours post dosing. On

Fexinidazole
Toxicokinetic Report for the study No. 0504-2007

Day 28, in males, mean \pm SD apparent terminal half-lives were 4.7 ± 1.2 , 8.8 ± 4.8 and 11 ± 2.7 hours after 50, 200 and 800 mg/kg/day, respectively. The corresponding female half-lives were 5.1 ± 5.1 , 6.3 ± 4.5 and 6.7 ± 2.3 (n=2) hours. In both genders, AUC_{0-t(last)} values of Fexinidazole increased with the dose (Figures 16 - 17).

Day 14 and Day 28 male AUC_{0-t(last)} (AUC within 24 hours post dosing on Day 28) accumulation ratios were, on average, 2.2 and 5.7 after 50 mg/kg/day, 1.6 and 2 after 200 mg/kg/day and 0.5 and 0.3 after 800 mg/kg/day, respectively. The corresponding values in females were 1.7 and 2, 1.3 and 1.5, 0.9 and 0.4.

Day 14 and Day 28 mean \pm SD systemic exposure to the sulfoxide metabolite is reported in the following table

| Dose | Male | | | Female | | |
|--------|------------------|------------------|-----------------------------------|---------------------------------|--------------------------|-------------------------------------|
| | mg/kg/day | C _{max} | t _{max} | AUC _{0-t(last)} | C _{max} | t _{max} |

⁽¹⁾ AUC within 24 hours post dosing

⁽²⁾ n=2

At each dose, the levels of the metabolite were about two - three times higher in the female than in the male rat. No relevant difference in the levels of the metabolite were observed on Day 28 compared to Day 14. In both genders, the maximal plasma concentrations of the sulfoxide metabolite were achieved, on average, 2 - 3 hours post dosing. On Day 28, mean \pm SD male apparent terminal half-lives were 5 ± 2 , 6.3 ± 2.9 and 6.6 ± 4.1 hours after 50, 200 and 800 mg/kg/day, respectively, whilst the corresponding female half-lives were 6.1 ± 3.8 , 8.1 ± 3.1 and 8.6 ± 2.3 (n=2) hours. In both genders, the systemic exposure to the metabolite increased with the dose (Figures 18 - 19).

Day 14 and Day 28 male AUC_{0-t(last)} (AUC within 24 hours post dosing on Day 28) accumulation ratios were, on average, 1.6 and 3.9 after 50 mg/kg/day, 1.2 and 1.5 after 200 mg/kg/day and 0.5 and 0.4 after 800 mg/kg/day, respectively. The corresponding values in females were 2.1 and 2.5, 1.6 and 1.5, 0.8 and 0.6.

The systemic exposure to the metabolite was much higher than that to the parent compound.

Fexinidazole
Toxicokinetic Report for the study No. 0504-2007

Day 14 and Day 28 mean \pm SD systemic exposure to the sulfone metabolite is reported in the following table

| Dose mg/kg/day | Male | | | Female | | |
|-------------------|---------------------------|--------------------------|--|---------------------------------|--------------------------|--|
| | C _{max} ng/mL | t _{max} hour | AUC _{0-t(last)} ng·hour/mL | C _{max} ng/mL | t _{max} hour | AUC _{0-t(last)} ng·hour/mL |

⁽¹⁾ AUC within 24 hours post dosing
⁽²⁾ n=2

At each dose, no relevant gender difference in C_{max} and AUC_{0-t(last)} values was observed. No relevant difference in the levels of the metabolite were observed on Day 28 compared to Day 14. T_{max} values of the metabolite were achieved at later times in comparison with the corresponding ones of the parent compound. On Day 28, mean male apparent terminal half-lives were 6.1 \pm 1.2, 7.5 \pm 2.4 and 10 \pm 3 hours after 50, 200 and 800 mg/kg/day, respectively, the corresponding half-lives in females were 13 \pm 9.8, 7.3 \pm 2.6 and 11 \pm 5.6 (n=2) hours. The systemic exposure to the metabolite increased with the dose (Figures 20 - 21).

Day 14 and Day 28 male AUC_{0-t(last)} (AUC within 24 hours post dosing on Day 28) accumulation ratios were, on average, 5.2 and 9.3 after 50 mg/kg/day, 2.3 and 2.9 after 200 mg/kg/day and 1.3 and 1.6 after 800 mg/kg/day, respectively. The corresponding values in females were 2.3 and 3.8, 2.3 and 2.6, 1 and 0.8.

The systemic exposure to the metabolite was much higher than that to the parent compound.

8. CONCLUSIONS

After the first and repeated administrations of the three dose levels, AUCs of Fexinidazole were two - three times higher in females than in males. On Days 1, 14 and 28, in both genders, AUCs of Fexinidazole increased with the dose administered. Whilst no accumulation was observed after the highest dose, in both genders, an accumulation ratio of Fexinidazole of about 2 was observed after 50 and 200 mg/kg/day.

After the first and repeated dosing to male and female rats, Fexinidazole was extensively metabolized to the sulfone and sulfoxide derivatives. The half-lives of both metabolites were similar to those of the parent compound.

Certificate of Analysis

Produktname

Chemical Name: 1-Methyl-2-(4-methylsulfonyl-phenoxy-methyl)-5-nitroimidazol
(Fexinidazol-sulfoxid)

Molecular formula: C₁₂H₁₃N₃O₄S

Molecular weight: 295.31

Project-Code: PU 83 III

Manufacturer: Gruppe Prof. Dr. J. S. Siegel, PU
 University of Zurich, Switzerland

Manufacturing Date: 11.2006

Analytical Analysis Order: 1106-I-0170

Test date: 06.11.06

Retest date: n/a

History of CoA: 06.11.06

| Tests | | Results |
|--|----------------------|----------------------|
| 1. Appearance | [visual] | colourless powder |
| 2. 1H-NMR / MS | [CDCl ₃] | confirms structure |
| 3. FT-IR (ATR) | [cm ⁻¹] | for information only |
| 4. HPLC Purity (LPF123G3.M) | [Area-%] | 99.34 |
| 4.1 Main Impurity | | 0.59 |
| 4.2 Sum of Impurities | | 0.62 |
| 5. Water (KFT) | [%] | 0.04 |
| 6. Chlorides (T, 0.005 N AgNO ₃) | [%] | n/a |
| 7. Residual Solvents (GC-Headspace) | [%] | |
| 7.1 Ethanol | | 0.02 |
| 7.2 Ether | | not detected |

All results described above (except NMR) were obtained on equipment qualified according to GMP procedures in use at the Analytical Laboratory of the LPF (AnLab-OCL).

For investigational use according to ICH Q7A, Chapter 19

Appendix 12 Pharmacy Documentation

Nerviano Medical Sciences

Pharmacy Certification

STUDY NUMBER : **0504-2007**
TEST ITEM : **Fexinidazole**
NOTEBOOK NUMBER(S) : **19202/B**

DOCUMENTATION ENCLOSED IN THE NOTEBOOK:

- A. Analysis certificate dated December 18, 2007 issued by Orgasynth Industries for Fexinidazole test item, raw material, Batch No. 3168-07-01/O
- B. Material safety data sheet issued by Orgasynth Industries for Fexinidazole
- C. Certificate of Analysis issued by Sigma-Aldrich for Tween® 80, raw material, Lot No. 1324202
- D. Certificate of Analysis issued by Sigma-Aldrich for Methylcellulose 400 cP, raw material, Lot No. 105K0196
- E. Certificate of Analysis issued by Sigma-Aldrich for Methylcellulose 400 cP, raw material, Lot No. 017K0087
- F. Label's photocopy of Acqua per preparazioni iniettabili (Bieffe Medital S.p.A.), raw material, Lot No. 07G0201
- G. Label's photocopy of Acqua per preparazioni iniettabili (Bieffe Medital S.p.A.), raw material, Lot No. 07K1503
- H. Request cards for Fexinidazole test item

ANALYTICAL DOCUMENTATION:

Requests and Analytical Results issued by Accelera/ADMET/Preclinical Formulation and Accelera/DMPK&ART/Bioanalysis and Analytical Control

MATERIALS USED FOR THE STUDY:

1. Fexinidazole test item, raw material, Batch No. 3168-07-01/O
2. Tween® 80, raw material, Lot No. 1324202
3. Methylcellulose 400 cP, raw material, Lot No. 105K0074
4. Methylcellulose 400 cP, raw material, Lot No. 017K0087
5. Acqua per preparazioni iniettabili, raw material, Lot No. 07G0201
6. Acqua per preparazioni iniettabili, raw material, Lot No. 07K1503

PREPARATIONS:

Prepare suspension of Fexinidazole test item, raw material, Lot No. 3168-07-01/O in the vehicle (5% Tween® 80 in 0.5% Methylcellulose 400 cP solution) at the concentration of 5 mg/mL, 20 mg/mL and 80 mg/mL

CONCENTRATION CHECKS:**Fexinidazole suspensions:**

| | | % of L.A. | Preparation date |
|----------|--------------------------------|-----------|-------------------|
| 80 mg/mL | Request No. 200800027 (Top) | 100.23% | February 04, 2008 |

STABILITY:**Fexinidazole test item:**

Expire date October 2008 for Fexinidazole, test item, raw material, Lot No. 3168-07-01/O if stored at room temperature protected from light.

Fexinidazole suspension:

Stability data indicate that Fexinidazole suspensions in the vehicle (5% Tween® 80 in 0.5% Methylcellulose 400 cP solution) in the range 0.5-100 mg/mL are stable up to 7 days at room temperature and 14 days at +4°C (Nerviano MS 0293-2007-R)

Date: April 17, 2008

Appendix 13 Clinical Pathology Methods

HEMATOLOGY METHODS

| PARAMETERS | CODE | UNIT | METHODS AND INSTRUMENTS |
|--|------|-------------------------|--|
| Red blood cells | RBC | n x 10 ⁶ /µL | Laser beam method. " ADVIA 120™ System" Bayer |
| Hemoglobin | HGB | g/dL | Colorimetric method as cyanmethemoglobin. "ADVIS 120™ System" Bayer |
| Hematocrit | HCT | % | Calculated: Wintrobe formulae "ADVIS 120™ System" Bayer |
| Mean corpuscular hemoglobin concentration | MCHC | g/dL | Calculated: Wintrobe formulae "ADVIS 120™ System" Bayer |
| Mean corpuscular volume | MCV | fL | Mean of RBC volume histogram x MCV calibration factor. "ADVIS 120™ System" Bayer |
| Mean corpuscular hemoglobin | MCH | pg | Calculated: Wintrobe formulae "ADVIS 120™ System" Bayer |
| Red cell distribution width | RDW | % | Calculated: Standard deviation of RBC volume histogram/MCV (fL) x 100. "ADVIS 120™ System" Bayer |
| Hemoglobin distribution width | HDW | g/dL | Calculated: Standard deviation of RBC HC histogram. "ADVIS 120™ System" Bayer |
| Reticulocytes | R | % | Laser beam method with colorimetric reaction for nucleic acids. "ADVIS 120™ System" Bayer |
| Reticulocytes absolutes | RAB | n x 10 ⁹ /L | Laser beam method with colorimetric reaction for nucleic acids. "ADVIS 120™ System" Bayer |
| Mean corpuscular volume of reticulocytes | MCVr | fL | Mean of R volume histogram x MCV calibration factor. "ADVIS 120™ System" Bayer |
| Mean hemoglobin concentration of reticulocytes | CHCM | g/dL | Mean of R hemoglobin histogram "ADVIS 120™ System" Bayer |
| Cellular hemoglobin of reticulocytes | CHR | pg | Calculated: Wintrobe formulae "ADVIS 120™ System" Bayer |
| Platelets | PLT | n x 10 ³ /µL | Laser beam method. "ADVIS 120™ System" Bayer |
| Mean platelet volume | MPV | fL | Mean platelet volume histogram "ADVIS 120™ System" Bayer |
| Platelet distribution width | PDW | % | Standard deviation of platelet volume histogram/ MPV (fL) x 100 "ADVIS 120™ System" Bayer |
| Platelet hematocrit | PCT | % | Mean platelet volume x PLT. "ADVIS 120™ System" Bayer |
| White blood cells | WBC | n x 10 ³ /µL | Laser beam method with "Baso/Lobularity method" and Peroxidase reaction. "ADVIS 120™ System" Bayer |

HEMATOLOGY METHODS (Cont.)

| PARAMETERS | CODE | UNIT | METHODS AND INSTRUMENTS |
|--|--|-------------------------|---|
| WBC differential count: Neutrophils Lymphocytes Eosinophils Basophils Monocytes Large unstained cells Band Neutrophils Segmented Neutrophils | N LY E B M LU BANN SEGN | % | Peroxidase and Basophil/Lobularity method "ADVIA 120™ System" Bayer Percentage of Band and Segmented Neutrophils manually calculated on 100 Neutrophils examined at microscopy |
| WBC differential count: Neutrophils ABS Lymphocytes ABS Eosinophils ABS Basophils ABS Monocytes ABS Large unstained cells ABS Band Neutrophils ABS Segmented Neutrophils ABS | NAB LYAB EAB BAB MAB LUAB BAAB SEAB | n x 10 ³ /µL | Peroxidase and Basophil/Lobularity method "ADVIA 120™ System" Bayer |
| | | | Absolute number of Band and Segmented Neutrophils calculated on percentage of Band and Segmented Neutrophils and value of NAB |

CLINICAL CHEMISTRY METHODS

| PARAMETERS | CODE | UNIT | METHODS AND INSTRUMENTS |
|----------------------------|-------|-------|--|
| Urea | UREA | mg/dL | Urease - GLDH": enzymatic UV test. Kit: Horiba ABX adapted to the "Pentra 400" analyzer. |
| Creatinine | CREA | mg/dL | Colorimetric complex between the creatinine and the alkaline picrate (Jaffé). Kit: Horiba ABX adapted to the "Pentra 400" analyzer. |
| Aspartate aminotransferase | AST | IU/L | UV-test according to IFCC modified method without pyridoxal phosphate. Kit: Horiba ABX adapted to the "Pentra 400" analyzer. |
| Alanine aminotransferase | ALT | IU/L | UV-test according to IFCC modified method without pyridoxal phosphate. Kit: Horiba ABX adapted to the "Pentra 400" analyzer. |
| Alkaline phosphatase | AP | IU/L | Kinetic photometric test, according to the IFCC. Kit: Horiba ABX adapted to the "Pentra 400" analyzer. |
| G-Glutamyl transferase | GGT | IU/L | Kinetic photometric test according to Szasz modified. Kit: Horiba ABX adapted to the "Pentra 400" analyzer. |
| Total bilirubin | T.BIL | mg/dL | Photometric test using 2,4-dichloroaniline. Kit: Horiba ABX adapted to the "Pentra 400" analyzer. |
| Total proteins | TPRO | g/dL | Biuret reaction. End-point method. Kit: Horiba ABX adapted to the "Pentra 400" analyzer. |
| Albumin | ALB. | g/dL | Colorimetric determination using bromocresol green. Kit: Horiba ABX adapted to the "Pentra 400" analyzer. |
| Globulin | GLOB | g/dL | Calculated parameter (T.Protein-Albumin) by Xybion. |
| Glucose | GLUC | mg/dL | Enzymatic determination. (Trinder method). Kit: Horiba ABX adapted to the "Pentra 400" analyzer. |
| Triglycerides | TG | mg/dL | Enzymatic determination Kit: Horiba ABX adapted to the "Pentra 400" analyzer. "CHOD-PAP": enzymatic photometric test. |
| Total Cholesterol | TCHO | mg/dL | (Trinder's reaction). Kit: Horiba ABX adapted to the "Pentra 400" analyzer. Photometric test using ortho-cresolphthalein complexone (OPC). |
| Calcium | Ca | mg/dL | Kit: Horiba ABX adapted to the "Pentra 400" analyzer. |
| Phosphorus | PHOS | mg/dL | UV method using phosphomolybdate Kit: Horiba ABX adapted to the "Pentra 400" analyzer. |
| Sodium | Na | mEq/L | Direct potentiometry ion selective electrodes. ISE module on the "Pentra 400" analyzer |
| Chloride | Cl | mEq/L | Direct potentiometry ion selective electrodes. ISE module on the "Pentra 400" analyzer |
| Potassium | K | mEq/L | Direct potentiometry ion selective electrodes. ISE module on the "Pentra 400" analyzer |
| Albumin/Globulin | A/G | | Calculated parameter by Xybion |

URINALYSIS METHODS

| PARAMETERS | CODE | UNIT | METHODS AND INSTRUMENTS |
|--|---|--|---|
| Appearance Limpid Turbid Light Turbid | L T LT | | Turbidimetric method with Urysis 2400 (Roche). |
| Colour: Yellow Amber Orange Greenish Reddish Brownish Colorless Other | Y A O G R B W O | | Photometric method with Urysis 2400 (Roche). |
| Volume | VOL | ml/16h | |
| Specific Gravity | S.G. | | Refractometric method with Urysis 2400 (Roche). |
| pH Proteins Nitrites Glucose Ketones Urobilinogen Bilirubin Hemoglobin/Red blood cells White blood cells | pH PRO NIT GLU KETO UBG BIL ERY WBC | Score 0-4 " 0-1 " 0-4 " 0-3 " 0-3 " 0-2 " 0-3 " 0-2 | Semi-quantitative determination with Sticks Urysis 2400 Cassette (Roche). Photometric method with Urysis 2400 (Roche). |

URINALYSIS METHODS (Cont.)

The scoring system is as follows:

| SCORE | PROTEINS mg/dL | NITRITES | GLUCOSE mg/dL | KETONES mg/dL | UROBIL. mg/dL | BILIR. mg/dL | WHITE B.CELLS WBC/ μ L | HEMOGLOBIN ERYTHROC. RBC/ μ L |
|-------|-------------------|----------|------------------|------------------|------------------|-----------------|----------------------------------|---|
| 0 | Absent | Absent | Absent | Up to 5 | Up to 1 | Up to 1 | Up to 25 | Up to 10 |
| 1 | Up to 25 | Present | Up to 50 | Up to 15 | Up to 4 | Up to 3 | Up to 100 | Up to 50 |
| 2 | Up to 75 | ... | Up to 100 | Up to 50 | Up to 8 | Up to 6 | Up to 500 | Up to 150 |
| 3 | Up to 150 | ... | Up to 300 | Up to 150 | Up to 12 | ... | ... | Up to 250 |
| 4 | Up to 500 | ... | Up to 1000 | ... | ... | ... | ... | ... |
