Figure S2. Box plot of the frequency of TFBSs (number of enriched motifs per sequence) around integration sites in HeLa cells of an MLV vector, an HIV vector, and an HIV vector packaged with an MLV integrase (HIVmIN) (vectors are identified in Figure 1). Statistical significance of differences in TFBS frequencies among groups (Wilcoxon rank sum test) is reported in Table S2. The $p$-value of some significant comparisons is indicated.
