**Primary B-CLL cells, patient #36**

Figure S12, Cea et al.

**Figure S12. FK866 and HDAC inhibitors synergistically kill primary B-CLL cells.** Primary B-CLL cells were incubated with or without FK866 at the indicated concentrations for 48 h. Thereafter, VA or vorinostat were added at the indicated concentrations. Viability was assessed 48 h later by PI cell staining and flow cytometry. CI values refer to the highest drug concentrations used. CI^CT's for each drug combination are presented in the lower insets.
