Figure S2. Δ6 and Δ5 desaturase activities are not involved in ACh-mediated vaso-relaxation. Values are mean ± SD (n = 6). (A) ACh +/- SC26196 in aortae; (B) ACh +/- SC26196 in mesenteric arteries. Statistical comparisons of effect of dose of inhibitor were by 1-Way ANOVA with Dunnett’s post hoc test. Values significantly different from ACh treatment alone are indicated by *P<0.05, **P<0.01, ***P<0.001, ****, P<0.0001.
