Figure S5. FISH on metaphases using EC buffer and formamide buffer. FISH on metaphase spreads using 15% EC buffer without Cot-1 blocking and 45% formamide buffer with Cot-1 blocking.

Denaturation at 82°C for 5 minutes, then hybridization at 45°C for 60 minutes. FITC/TxRed, merge of green and red BCL2 DNA split probe signals. DAPI, blue staining. Images are taken with identical exposure times. Arrows, show probe location. Scale bar, 10 µm.
