Table S3. Estimates of percentage extremely low density elephant range across the Central African forests and by country (relative to each country’s forested area) for 2002 and 2011 for the top-ranking predictive models, which included the survey year variable. Elephants are assumed to be almost absent when dung density falls below a threshold value of 100 elephant dung piles/km². Also shown are estimates of the percentage of potential habitat at high elephant density (defined as > 1,000 elephant dung piles/km²). The average across all models for 2002 and for 2011 is shown, as well as the range Table S6 for a breakdown of forest cover by country.
