Supp Fig S3: susceptibility to puromycin aminonucleoside
Figure legend for supplementary Fig S3: SDS-PAGE of urine from littermates on a pure C57BL/6 background following challenge with puromycin aminonucleoside. Albumin standards were loaded on each gel (BSA in ug/lane). Each urine lane is labeled with the mouse genotype (KO, DHet control, FF control) and type of injection (saline, or puromycin in mg/kg). Samples were loaded by tag#, blinded to genotype and injection. Day 0 urine samples were loaded in a different order into lanes and also showed no albuminuria. One gel (group2, day 6) is missing the last lane due to fecal contamination of the urine sample on that day.
