Appendix S3

Equivalence of the shifting to $R(t)$ and that to $R'(t)$

According to Eq. (3) in the main body of the paper, $R'(t)$ is defined as

$$R'(t) = k \cdot \sum_{i=1}^{M} \left[ \gamma_i \sum_{j=0}^{i-1} R(t - j) \right].$$

To prove that the shifting to $R(t)$ is equivalent to the shifting to $R'(t)$, it’s identical to prove the equation:

$$R'(t) + c = k \cdot \sum_{i=1}^{M} \left\{ \gamma_i \sum_{j=0}^{i-1} [R(t - j) + c] \right\},$$

where $c$ is a constant. The term on the right-hand side of this equation is

$$k \cdot \sum_{i=1}^{M} \left\{ \gamma_i \sum_{j=0}^{i-1} [R(t - j) + c] \right\} = k \cdot \sum_{i=1}^{M} \left[ \gamma_i \sum_{j=0}^{i-1} R(t - j) + \gamma_i \sum_{j=0}^{i-1} c \right]$$

$$= k \cdot \sum_{i=1}^{M} \left[ \gamma_i \sum_{j=0}^{i-1} R(t - j) \right] + k \cdot \sum_{i=1}^{M} (\gamma_i \cdot i \cdot c)$$

$$= R'(t) + k \cdot \sum_{i=1}^{M} (\gamma_i \cdot i \cdot c).$$

Since $k = 1/(\sum_{i=1}^{M} \sum_{j=0}^{M} \gamma_j)$, we have

$$k \cdot \sum_{i=1}^{M} \left\{ \gamma_i \sum_{j=0}^{i-1} [R(t - j) + c] \right\} = R'(t) + \frac{\sum_{i=1}^{M} (\gamma_i \cdot i \cdot c)}{\sum_{i=1}^{M} \sum_{j=1}^{M} \gamma_j}$$

$$= R'(t) + c \cdot \frac{\sum_{i=1}^{M} (i \cdot \gamma_i)}{\gamma_1 + \gamma_2 + \cdots + \gamma_M}$$

$$= R'(t) + c \cdot \frac{\sum_{i=1}^{M} (i \cdot \gamma_i)}{\gamma_1 + 2\gamma_2 + 3\gamma_3 + \cdots + M\gamma_M}$$

Therefore, the shifting to $R(t)$ is equivalent to the shifting to $R'(t)$.
