Figure S9. Expression of VIP1 variants does not affect ABA-induced inhibition of seed germination.

Seeds were sown on 0.5× MS medium containing 0 (Control) or 0.25 μM ABA, incubated 48 hours at 4 °C for stratification, and further incubated at 22 °C. Germinated seeds were counted at the time points indicated after seeds were transferred to the 22 °C. The experiment was repeated three times, and data were averaged (n = 40 for each experiment). The error bars indicate SD.
