Figure S2. *copM* is expressed in cells cultured in standard BG11C medium under steady-state conditions. Northern-blot analysis of the expression of *copM* in wild-type cells cultured in either standard copper concentration medium (BG11C) or low copper medium (BG11C-Cu). Total RNA was isolated from cells after two cycles of growth up to mid-log phase in BG11C or BG11C-Cu. The filter was hybridized with *copM*, and subsequently stripped and re-hybridized with an *rnpB* probe as a control.
