Figure S6 shows the network meta-analysis results of the effect of antidiabetic therapies on the risk of confirmed hypoglycemia. The table lists various therapies and their corresponding effectiveness measures, such as odds ratios (OR) and risk ratios (RR), along with confidence intervals (CI) and p-values. The data is organized in a tabular format, with columns representing different therapies and rows indicating study outcomes. The significance of the results is indicated by asterisks next to the p-values.
