</table>

The table gives the number of the climate station used (no.; corresponding to the respective source) and its name (name) for each region as well as the latitude (lat.), longitude (long.), and altitude (alt.) of the station. Further, the year of the oldest data point for monthly mean temperature (temp.) and monthly precipitation sum (prec.) is given. In the last column the source of the data is shown. The climatic data were acquired from the AlpImp-Project [1], the Central Institute for Meteorology and Geodynamics (ZAMG, www.zamg.ac.at), the German weather service (DWD; www.dwd.de), and from www.tutiempo.net (TUT). Data from the AlpImp-Project [1] were homogenized and only available until 2006 so that a second source was used for newer data. For incomplete monthly data points from TUT the mean temperature was calculated anyway and monthly precipitation sum was extrapolated to the full month if there were at least 20 days of data available in the respective month.
