**S3 Fig. N-PPE17 inhibits detection of antibody response of TB patients to PPE17 in concentration-dependent manner.** The EIA plate coated with either N-terminal fragment of PPE17 or full-length PPE17 antigen was incubated with 50 µl sera (n = 40) that were either left untreated or pre-incubated with 1µg (20 µg/ml) or 3 µg (60 µg/ml) of N-PPE17 protein. The plates were further incubated with anti-human IgG-HRP and absorbance was read at 492 nm using OPD.
