Figure S6 Immunoblot using SalmonE and 73.18 to R5, ME49 and Pru strains of *T. gondii* and to Δcst1 and Δsrs13 strains in KU80Pru *T. gondii*.

This demonstrates that mAb SalmonE binds to several type II strain *T. gondii* parasites and that a similar sized band is seen in these parasites. This immunoblot also demonstrates that monoclonal 73.18 binds to this high molecular weight band (recognized by mAb SalmonE) as well as a smaller band that we have identified as SRS13 (Weiss unpublished). The ΔSRS13 strain still reacts with mABSalmone at 250 kDa but lacks the lower molecular weight bands.
