Supplemental Table 5A. List of genes containing conserved Early-1, Early-2 and PHA-4 sites within 500 bp upstream of their predicted start codons. Green genes are expresssd in the pharynx, while red genes are not; * = genes identified as positives in our microarray experiments. ‘NA’ = no expression pattern information available. For references, ‘YK’ refers to the Kohara group’s Nematode Expression Pattern Database (NEXTDB); interpretation of the available *in situ* hybridization patterns was performed by the authors of this paper. The ClusterBuster (Frith et al. 2003) parameters for E1+E2 combined were C=3.5, m=6 g=35. The PHA-4 parameters were C=1.9, m=6, g=35.
