We consider two additional graph structures (random and hub graph) and three sets of parameters, namely, ($p = 50, n = 50$), ($p = 50, n = 100$), and ($p = 100, n = 100$). For each experiment, we average over 100 simulation runs with standard deviations in round brackets. We use three metrics (L_1 , ACC, AUPR) to quantify the performance. Bold number shows best result.
