```

Note that some of the plots below use the “ErrorBarLogPlots” package, which has to be downloaded separately (<http://library.wolfram.com/infocenter/MathSource/6747/>).

Supplementary Material SI: Setting up the mathematical model

Basic Model outline, numerical evaluation

In this problem there is an initial infected pathogen, or cell–line, the size of which at time t is denoted $x[t]$. This grows over time deterministically according to the following equation, which is well-used for within-host models (e.g. Alizon and van Baalen 2008):

$$\frac{dx}{dt} = x(\varphi - \sigma y)$$

Where φ is the growth rate, σ the death rate due to immunity, and y the density/population of immune cells. Immune growth is represented with a logistic-growth model given the presence of infection:

$$\frac{dy}{dt} = rxy\left(1 - \frac{y}{K}\right)$$

Here, r is the logistic growth rate of immunity, and K is the maximum/carrying capacity of the immune response.

In this model, if $\varphi/\sigma < K$ (see below for a rational for this), then the first strain will increase in frequency until the immune-cells reach a critical size. After this point, the infection cells will decrease and go extinct, while the immune response will be maintained at a non-zero size. Below shows a numerical evaluation of this ODE set, with $\varphi = 1$, $\sigma = r = 0.1$, and $K = 100$. It is clear that with this example, the infection line goes extinct very quickly, after only 6-7 generations. This is because the maximum size

that the infection line can achieve is equal to ϕ/σ unless K is very small, which we will show below.

```
sol = NDSolve[{x'[t] == (1 - 0.1 y[t]) x[t],
  y'[t] == 0.1 x[t] y[t] (1 -  $\frac{y[t]}{100}$ ), x[0] == 1, y[0] == 1}, {x, y}, {t, 0, 20}]
{{x -> InterpolatingFunction[{{0., 20.}}, <>],
  y -> InterpolatingFunction[{{0., 20.}}, <>]}}
Plot[Evaluate[{x[t], y[t]} /. sol], {t, 0, 10}]
```

With $\phi/\sigma > K$, then the parasite can escape immunity and rapidly increase in size. This is exemplified below with $\phi = 1$, $\sigma = r = 0.009$ (so $\phi/\sigma \approx 111$).

```
sol2 = NDSolve[{x'[t] == (1 - 0.009 y[t]) x[t],
  y'[t] == 0.009 x[t] y[t] (1 -  $\frac{y[t]}{100}$ ), x[0] == 1, y[0] == 1}, {x, y}, {t, 0, 20}]
{{x -> InterpolatingFunction[{{0., 20.}}, <>],
  y -> InterpolatingFunction[{{0., 20.}}, <>]}}
Plot[Evaluate[{x[t], y[t]} /. sol2], {t, 0, 10}]
```

Solving differential equations, for use in potential analytical solution

To make sure we know the general behaviour of the system, as well as work out when realistic behaviour arises, we will now analyse the basic properties of the system to determine the maximum

growth rates, how to create analytical solutions for the infected cell-line, and so on. We start with the initial system of equations.

$$\frac{dx}{dt} = (\phi - \sigma y) x$$

$$\frac{dx}{dt} = x (-y \sigma + \phi)$$

$$\frac{dy}{dt} = r x y \left(1 - \frac{y}{Ka}\right)$$

$$\frac{dy}{dt} = r x y \left(1 - \frac{y}{Ka}\right)$$

We then follow the approach of Hartfield and Alizon (2014) by noting that since dy/dt is always ≥ 0 , we can simplify this system by using the immune-cell population size as a proxy for time instead, and write $x(y)$. In this case, dx/dy equals:

$$\frac{(\phi - \sigma y) x}{r x y \left(1 - \frac{y}{Ka}\right)} // \text{FullSimplify}$$

$$\frac{Ka (-y \sigma + \phi)}{r (Ka - y) y}$$

To further simplify, we will make the following substitutions. The reproductive rate in the absence of immune response (or when it equals 1 since we assume it is never extinct) equals $R = \phi/\sigma$. We can also reduce the number of parameters by setting $\rho = r/\sigma$ (this can be formally shown by rescaling time in the initial system by $\tau = \sigma t$). After making substitutions regarding R, ρ , we obtain:

$$\frac{Ka (-y \sigma + \phi)}{r (Ka - y) y} /. \{\phi \rightarrow R \sigma\} // \text{FullSimplify}$$

$$\frac{r (Ka - y) y}{Ka (R - y) \sigma}$$

$$r (Ka - y) y$$

$$\frac{Ka (R - y) \sigma}{r (Ka - y) y} /. \{r \rightarrow \rho \sigma\} // \text{FullSimplify}$$

$$\frac{Ka R - Ka y}{Ka y \rho - y^2 \rho}$$

$$Ka y \rho - y^2 \rho$$

Or:

$$\frac{Ka (R - y)}{y \rho (Ka - y)} - \left\{ \frac{Ka R - Ka y}{Ka y \rho - y^2 \rho} \right\} // \text{Simplify}$$

$$\{0\}$$

This gives us a simple differential equation that can be easily solved.

$$\text{DSolve}\left[\left\{x'[y] == \frac{Ka (R - y)}{y \rho (Ka - y)}, x[y_0] == x_0\right\}, x[y], y\right] // \text{Simplify}$$

$$\left\{ \left\{ x[y] \rightarrow \frac{1}{\rho} \left(x_0 \rho + R \text{Log}[y] + (Ka - R) \text{Log}[-Ka + y] - R \text{Log}[y_0] - Ka \text{Log}[-Ka + y_0] + R \text{Log}[-Ka + y_0] \right) \right\} \right\}$$

```

D[ $\frac{1}{\rho} (x0 \rho + R \text{Log}[y] + (Ka - R) \text{Log}[-Ka + y] - R \text{Log}[y0] - Ka \text{Log}[-Ka + y0] + R \text{Log}[-Ka + y0])$ ,
  y] // Simplify
 $\frac{Ka R - Ka y}{Ka y \rho - y^2 \rho}$ 

D[ $x0 + \frac{1}{\rho} \left( \text{Log}\left[\left(\frac{y}{y0}\right)^R \left(\frac{Ka - y}{Ka - y0}\right)^{Ka-R}\right] \right)$ , y] // Simplify
 $\frac{Ka R - Ka y}{Ka y \rho - y^2 \rho}$ 

Log[ $\left(\frac{y}{y0}\right)^R \left(\frac{Ka - y0}{Ka - y}\right)^R \left(\frac{Ka - y}{Ka - y0}\right)^{Ka}$ ]
Log[ $\left(\frac{Ka - y}{Ka - y0}\right)^{Ka} \left(\frac{Ka - y0}{Ka - y}\right)^R \left(\frac{y}{y0}\right)^R]$ ]

 $\frac{-Ka + y}{-Ka + y0} - \frac{Ka - y}{Ka - y0}$  // Simplify
0

```

By combining the logarithm terms, we can write this solution in a much more compact form instead.

```

FX3[Ka_, R_, rho_, x0_, y0_, y_] := x0 +  $\frac{1}{\rho} \left( \text{Log}\left[\left(\frac{y}{y0}\right)^R \left(\frac{Ka - y}{Ka - y0}\right)^{Ka-R}\right] \right)$ 

```

Now let's focus on the behaviour of these solutions. First, what is the maximum value of Y needed? Unfortunately, this cannot be found analytically, and using the simplified form of the solution (where $Ka \rightarrow \infty$) will be inaccurate. But we can set up a function to find this numerically ('YMaxN' below).

```

Solve[x0 +  $\frac{1}{\rho} \left( \text{Log}\left[\left(\frac{y}{y0}\right)^R \left(\frac{Ka - y}{Ka - y0}\right)^{Ka-R}\right] \right) == 0, y]$ 

```

```

Solve[x0 +  $\frac{\text{Log}\left[\left(\frac{Ka - y}{Ka - y0}\right)^{Ka-R} \left(\frac{y}{y0}\right)^R\right]}{\rho} == 0, y]$ 

```

```

YMaxN[Ka_, R_, rho_, x0_, y0_] := FindRoot[x0 +  $\frac{1}{\rho} \left( \text{Log}\left[\left(\frac{y}{y0}\right)^R \left(\frac{Ka - y}{Ka - y0}\right)^{Ka-R}\right] \right) == 0, \{y, R\}]$ 

```

```
YMaxN[100, 50, 10, 1, 1]
```

```
{y -> 99.1828}
```

Second question: When is the maximum X value obtained, and what parameters affects this value? From the form of the differential equation, it is clear that it is zero when $y = R$:

```

Solve[ $\frac{Ka (R - y)}{y \rho (Ka - y)} == 0, y]$ 

```

```
{{y -> R}}
```

Thus the max value of x occurs for $y = R$. Interestingly enough, ρ has no effect on the *position* of the peak, although it clearly has some effect on growth rates if we run some numerical simulations of the system.

On the emergence probability, for a static and changing population

From the form of $x'[y]$, it is clear that the first infection will increase in frequency if $R-y > 0$, where R is the reproductive ratio in the absence of immunity, $\frac{\phi}{\sigma}$. For this model to make sense, R needs to be high initially, since the pathogen dies out if the number of immune cells $y > R$. For example, if $R = 10$, then the initial extinction probability equals $\frac{1}{R} = 0.1$, quite low. But once y exceeds 10, extinction is certain.

`Plot[ $\frac{y}{10}$ , {y, 1, 10}]`

Therefore the same logic must apply with regards to emergence of the new pathogen. Say it has growth rate Φ and death rate (in absence of immunity) of Σ , then its baseline reproductive rate $R_2 = \frac{\Phi}{\Sigma}$ must exceed K in order for it to have any chance of completely escaping immune proliferation.

The total emergence probability is given by the 'evolutionary rescue' equation, $1 - \text{Exp}[-\mu \int x[y] \Pi[y] dy]$, where x is the population size of first cell-line and Π is the emergence probability. Preliminary results showed that using $\Pi = 1-y/R_2$ greatly overestimated emergence probability compared to simulations, so we needed to account for the proliferation of the first parasite. We will first show how it is not possible to derive exact analytical solutions for Π , then how one can create an approximation based on previous solutions.

1) One-strain emergence equation (with $x_1 = 1$). To try and find a solution, we'll form a branching-process-type differential-equation that we will then solve. Let Q be the extinction probability. Then it might give birth a new cell with prob. ϕ , meaning there will be two cells that might eventually die out; the initial cell might die with prob σy ; or no birth or death will arise with prob $(1-\phi-\sigma y)$. We can form an equation for dQ/dt based on this logic; furthermore, by dividing by dy/dt when $x = 1$, we further obtain an equation for dQ/dy .

$$\frac{\phi Q^2 + \sigma y - (\phi + \sigma y) Q}{r y \left(1 - \frac{y}{Ka}\right)} \quad // \text{ Simplify}$$

$$\frac{Ka (-1 + Q) (-y \sigma + Q \phi)}{r (Ka - y) y}$$

Subbing in values for R , ρ :

$$\frac{\mathbf{Ka} (-1 + \mathbf{Q}) (-\mathbf{y} \sigma + \mathbf{Q} \phi)}{\mathbf{r} (\mathbf{Ka} - \mathbf{y}) \mathbf{y}} /. \{\phi \rightarrow \mathbf{R} \sigma, \mathbf{r} \rightarrow \rho \sigma\} // \mathbf{FullSimplify}$$

$$\frac{\mathbf{Ka} (-1 + \mathbf{Q}) (\mathbf{Q} \mathbf{R} - \mathbf{y})}{(\mathbf{Ka} - \mathbf{y}) \mathbf{y} \rho}$$

We can re-write this as:

$$\frac{\mathbf{Ka} (1 - \mathbf{Q}) (\mathbf{y} - \mathbf{Q} \mathbf{R})}{(\mathbf{Ka} - \mathbf{y}) \mathbf{y} \rho} - \left\{ \frac{\mathbf{Ka} (-1 + \mathbf{Q}) (\mathbf{Q} \mathbf{R} - \mathbf{y})}{(\mathbf{Ka} - \mathbf{y}) \mathbf{y} \rho} \right\} // \mathbf{Simplify}$$

$$\{0\}$$

If we assume that $dQ/dy = 0$, then we obtain classical solutions for the extinction probability.:

$$\mathbf{Solve}\left[\frac{\mathbf{Ka} (1 - \mathbf{Q}) (\mathbf{y} - \mathbf{Q} \mathbf{R})}{(\mathbf{Ka} - \mathbf{y}) \mathbf{y} \rho} == 0, \mathbf{Q}\right]$$

$$\left\{\{\mathbf{Q} \rightarrow 1\}, \left\{\mathbf{Q} \rightarrow \frac{\mathbf{y}}{\mathbf{R}}\right\}\right\}$$

But if not, we will try and solve the resulting differential equation...

$$\mathbf{DSolve}\left[\left\{-\mathbf{D}[\mathbf{Q}[\mathbf{y}], \mathbf{y}] == \frac{\mathbf{Ka} (1 - \mathbf{Q}[\mathbf{y}]) (\mathbf{y} - \mathbf{Q}[\mathbf{y}] \mathbf{R})}{(\mathbf{Ka} - \mathbf{y}) \mathbf{y} \rho}, \mathbf{Q}[\mathbf{y0}] == \frac{\mathbf{y0}}{\mathbf{R}}\right\}, \mathbf{Q}[\mathbf{y}], \mathbf{y}\right] // \mathbf{Simplify}$$

$$\begin{aligned}
& \{ \{ Q[Y] \rightarrow \left((-Ka + Y)^{R/\rho} \left(1 - \frac{Y}{Ka} \right)^{Ka/\rho} (R - Y0) Y0^{R/\rho} (-Ka + Y0)^{Ka/\rho} \right. \\
& \quad \left(1 - \frac{Y0}{Ka} \right)^{R/\rho} \text{Hypergeometric2F1} \left[-\frac{R}{\rho}, \frac{Ka - R + \rho}{\rho}, 1 - \frac{R}{\rho}, \frac{Y}{Ka} \right] + \left(1 - \frac{Y}{Ka} \right)^{R/\rho} \\
& \quad \left(\left(1 - \frac{Y0}{Ka} \right)^{R/\rho} \left(-R (-Ka + Y)^{R/\rho} Y0^{R/\rho} (-Ka + Y0)^{Ka/\rho} + (-Ka + Y)^{R/\rho} Y0^{\frac{R+\rho}{\rho}} (-Ka + Y0)^{Ka/\rho} + \right. \right. \\
& \quad \left. \left. R Y^{R/\rho} (-Ka + Y)^{Ka/\rho} (-Ka + Y0)^{R/\rho} \right) - Y^{R/\rho} (-Ka + Y)^{Ka/\rho} (R - Y0) (-Ka + Y0)^{R/\rho} \right. \\
& \quad \left. \left(1 - \frac{Y0}{Ka} \right)^{Ka/\rho} \text{Hypergeometric2F1} \left[-\frac{R}{\rho}, \frac{Ka - R + \rho}{\rho}, 1 - \frac{R}{\rho}, \frac{Y0}{Ka} \right] \right) \Bigg/ \\
& \quad \left((-Ka + Y)^{R/\rho} \left(1 - \frac{Y}{Ka} \right)^{Ka/\rho} (R - Y0) Y0^{R/\rho} (-Ka + Y0)^{Ka/\rho} \left(1 - \frac{Y0}{Ka} \right)^{R/\rho} \right. \\
& \quad \text{Hypergeometric2F1} \left[-\frac{R}{\rho}, \frac{Ka - R + \rho}{\rho}, 1 - \frac{R}{\rho}, \frac{Y}{Ka} \right] + \\
& \quad Y^{R/\rho} (-Ka + Y)^{Ka/\rho} \left(1 - \frac{Y}{Ka} \right)^{R/\rho} (-Ka + Y0)^{R/\rho} \left(R \left(1 - \frac{Y0}{Ka} \right)^{R/\rho} - (R - Y0) \left(1 - \frac{Y0}{Ka} \right)^{Ka/\rho} \right. \\
& \quad \left. \left. \text{Hypergeometric2F1} \left[-\frac{R}{\rho}, \frac{Ka - R + \rho}{\rho}, 1 - \frac{R}{\rho}, \frac{Y0}{Ka} \right] \right) \right) \Bigg\} // \text{FullSimplify} \\
& \{ \{ Q[Y] \rightarrow \\
& \quad \left((-Ka + Y)^{R/\rho} (R - Y0) Y0^{R/\rho} (-Ka + Y0)^{Ka/\rho} \left(-1 + \text{Hypergeometric2F1} \left[1, -\frac{Ka}{\rho}, 1 - \frac{R}{\rho}, \frac{Y}{Ka} \right] \right) + \right. \\
& \quad Y^{R/\rho} (-Ka + Y)^{Ka/\rho} (-Ka + Y0)^{R/\rho} \\
& \quad \left. \left(R + (-R + Y0) \text{Hypergeometric2F1} \left[1, -\frac{Ka}{\rho}, 1 - \frac{R}{\rho}, \frac{Y0}{Ka} \right] \right) \right) \Bigg/ \\
& \quad \left((-Ka + Y)^{R/\rho} (R - Y0) Y0^{R/\rho} (-Ka + Y0)^{Ka/\rho} \text{Hypergeometric2F1} \left[1, -\frac{Ka}{\rho}, 1 - \frac{R}{\rho}, \frac{Y}{Ka} \right] + Y^{R/\rho} \right. \\
& \quad \left. (-Ka + Y)^{Ka/\rho} (-Ka + Y0)^{R/\rho} \left(R + (-R + Y0) \text{Hypergeometric2F1} \left[1, -\frac{Ka}{\rho}, 1 - \frac{R}{\rho}, \frac{Y0}{Ka} \right] \right) \right) \Bigg\} \}
\end{aligned}$$

Clearly, this is a large solution and a bit of a mess!

Guess1[Ka_, R_, ρ_, Y0_, Y_] :=

$$\begin{aligned}
& \left((-Ka + Y)^{R/\rho} (R - Y0) Y0^{R/\rho} (-Ka + Y0)^{Ka/\rho} \left(-1 + \text{Hypergeometric2F1} \left[1, -\frac{Ka}{\rho}, 1 - \frac{R}{\rho}, \frac{Y}{Ka} \right] \right) + \right. \\
& \quad Y^{R/\rho} (-Ka + Y)^{Ka/\rho} (-Ka + Y0)^{R/\rho} \left(R + (-R + Y0) \text{Hypergeometric2F1} \left[1, -\frac{Ka}{\rho}, 1 - \frac{R}{\rho}, \frac{Y0}{Ka} \right] \right) \Bigg/ \\
& \quad \left((-Ka + Y)^{R/\rho} (R - Y0) Y0^{R/\rho} (-Ka + Y0)^{Ka/\rho} \text{Hypergeometric2F1} \left[1, -\frac{Ka}{\rho}, 1 - \frac{R}{\rho}, \frac{Y}{Ka} \right] + \right. \\
& \quad \left. Y^{R/\rho} (-Ka + Y)^{Ka/\rho} (-Ka + Y0)^{R/\rho} \left(R + (-R + Y0) \text{Hypergeometric2F1} \left[1, -\frac{Ka}{\rho}, 1 - \frac{R}{\rho}, \frac{Y0}{Ka} \right] \right) \right)
\end{aligned}$$

Furthermore, it does not seem to evaluate for realistic values, indicating some sort of complexity problem...

We decided that the best way to proceed was to create an estimate for Π , based on the results found in Hartfield and Alizon 2014. As explained in the main manuscript, we tried taking the emergence probability, $(R2-y0)/R2$, and add on a $\rho(x1+1)y(1-y/K)$ term to the denominator, to account for immune growth.

This term was then multiplied by the diffusion solution for emergence, $\left(1 - \text{Exp}\left[-\frac{2(R2-y)}{R2+y}\right]\right)$, to create a scaled equation for the emergence probability.

```
YFixG1X[Ka_, R_, R2_, rho_, x0_, y0_, y_] :=
```

$$\left((R2 - y0) / ((1 + \text{FX3}[Ka, R, \rho, x0, y0, y]) (Ka - y) y \rho + R2 - y0) \right) \left(1 - \text{Exp}\left[-\frac{2(R2 - y)}{R2 + y}\right] \right)$$

Plotting this with known values below suggests that this is valid, up until a discontinuity is reached.

```
Plot[YFixG1X[100, 60, 120, 1, 1, 20, y], {y, 20, 92}]
```

We can numerically find the y value causing this discontinuity, which represents the maximum possible y before emergence becomes impermissible.

```
YMaxGN[Ka_, R_, R2_, ρ_, x0_, y0_] :=
  Floor[y /. FindRoot[(1 + FX3[Ka, R, ρ, x0, y0, y]) (Ka - y) y ρ + R2 - y0 == 0, {y,  $\frac{3R}{2}}$ ]]

YMaxGN[100, 60, 120, 1, 1, 20]
92
```

Caution: If re-using this code, it is **imperative** to test whether the above function has a ‘good’ initial guess for finding the root of the denominator. Otherwise a different zero might be found, leading to inaccurate computation. For example, if the first guess at a root was set at 200 instead:

```
YMaxGN[Ka_, R_, R2_, ρ_, x0_, y0_] :=
  Floor[y /. FindRoot[(1 + FX3[Ka, R, ρ, x0, y0, y]) (Ka - y) y ρ + R2 - y0 == 0, {y, 200}]]

YMaxGN[100, 60, 120, 1, 1, 20]
106
```

Which is not correct.

Plots of Equations 5 and 10 (in the main text) for different parameter values

Equation 5 (dynamics of first strain as a function of immune size)

We first re-define the function $x_1(y)$ and the maximum value of y , for ease of plotting:

```
FX3[Ka_, R_, ρ_, x0_, y0_, y_] := x0 +  $\frac{1}{\rho} \left( \text{Log} \left[ \left( \frac{y}{y0} \right)^R \left( \frac{Ka - y}{Ka - y0} \right)^{Ka - R} \right] \right)$ 
YMaxN[Ka_, R_, ρ_, x0_, y0_] :=
  y /. FindRoot[x0 +  $\frac{1}{\rho} \left( \text{Log} \left[ \left( \frac{y}{y0} \right)^R \left( \frac{Ka - y}{Ka - y0} \right)^{Ka - R} \right] \right) == 0, \{y, R\}]$ 
```

Below are plots for $K = 100$, $R_1 = 60$, $\rho = 0.5$ (blue) and 9 (red).

```
a2 = Plot[{FX3[100, 60, 9, 1, 20, y]}, {y, 21, y /. YMaxN[100, 60, 9, 1, 20]}],
  PlotRange -> All, PlotStyle -> {Red}, AxesOrigin -> {0, 0};
a1 = Plot[{FX3[100, 60, 0.5, 1, 20, y]}, {y, 21, y /. YMaxN[100, 60, 0.5, 1, 20]}];
Show[a1, a2]
```

Below are plots for $K = 1000$, $R_1 = 100$, $\rho = 0.5$ (blue) and 9 (red).

```

a2 = Plot[{FX3[1000, 100, 9, 1, 20, y]}, {y, 21, y /. YMaxN[1000, 100, 9, 1, 20]},
  PlotRange -> All, PlotStyle -> {Red}, AxesOrigin -> {0, 0}];
a1 = Plot[{FX3[1000, 100, 0.5, 1, 20, y]},
  {y, 21, y /. YMaxN[1000, 100, 0.5, 1, 20]}, AxesOrigin -> {0, 0}];
Show[
  a1,
  a2]

```

Below are plots for $K = 10,000$, $R_1 = 1000$, $\rho = 0.5$ (blue) and 9 (red). We also slightly redefine the function to find the maximum permissible value of y to change the starting value for finding the root, otherwise inaccurate values would be obtained.

```

YMaxN[Ka_, R_, ρ_, x0_, y0_] :=
  y /. FindRoot[x0 + 1/ρ (Log[(y/y0)^R ((Ka - y)/(Ka - y0))^(Ka - R)]) == 0, {y, 3 * Ka/4}]

a2 = Plot[{FX3[10000, 1000, 9, 1, 20, y]}, {y, 21, YMaxN[10000, 1000, 9, 1, 20]},
  PlotRange -> All, PlotStyle -> {Red}, AxesOrigin -> {0, 0}];
a1 = Plot[{FX3[10000, 1000, 0.5, 1, 20, y]},
  {y, 21, YMaxN[10000, 1000, 0.5, 1, 20]}, AxesOrigin -> {0, 0}];
Show[
  a1,
  a2]

```

Equation 10 (dynamics of emergence probability Π as a function of immune size)

We first re-define the emergence probability Π :

```

YFixG1X[Ka_, R_, R2_, ρ_, x0_, y0_, y_] :=
  ((R2 - y0) / ((1 + FX3[Ka, R, ρ, x0, y0, y]) (Ka - y) y ρ + R2 - y0))
  (1 - Exp[- $\frac{2 (R2 - y)}{R2 + y}$ ]) (* Mutated strain emergence, Π *)

YMaxGN[Ka_, R_, R2_, ρ_, x0_, y0_] :=
  Floor[y /. FindRoot[(1 + FX3[Ka, R, ρ, x0, y0, y]) (Ka - y) y ρ + R2 - y0 == 0, {y,  $\frac{3 R}{2}}$ ]]
  (* Function to find when Π becomes inadmissible *)

```

Plots for K = 100, R1 = 60, ρ = 0.5, and R2 equals either 110, 130, or 150.

```

b1 = Plot[YFixG1X[100, 60, 110, 0.5, 1, 20, y],
  {y, 21, YMaxGN[100, 60, 110, 0.5, 1, 20]}};
b2 = Plot[YFixG1X[100, 60, 130, 0.5, 1, 20, y],
  {y, 21, YMaxGN[100, 60, 130, 0.5, 1, 20]}};
b3 = Plot[YFixG1X[100, 60, 150, 0.5, 1, 20, y],
  {y, 21, YMaxGN[100, 60, 150, 0.5, 1, 20]}};
Show[
  b1,
  b2,
  b3]

```

Supplementary Material S2: Testing against stochastic simulations

Function Definitions

First we list all the relevant equations needed for the computation, so they can be easily reloaded. Note that some of the plots below use the “ErrorBarLogPlots” package, which has to be downloaded separately (<http://library.wolfram.com/infocenter/MathSource/6747/>).

```

FX3[Ka_, R_, ρ_, x0_, y0_, y_] :=
  x0 +  $\frac{1}{\rho} \left( \text{Log} \left[ \left( \frac{y}{y0} \right)^R \left( \frac{Ka - y}{Ka - y0} \right)^{Ka - R} \right] \right)$  (* First pathogen size x as a function of y *)

YFixG1X[Ka_, R_, R2_, ρ_, x0_, y0_, y_] :=
  ((R2 - y0) / ((1 + FX3[Ka, R, ρ, x0, y0, y]) (Ka - y) y ρ + R2 - y0))
   $\left( 1 - \text{Exp} \left[ - \frac{2 (R2 - y)}{R2 + y} \right] \right)$  (* Mutated strain emergence, Π *)

YMaxGN[Ka_, R_, R2_, ρ_, x0_, y0_] :=
  Floor[y /. FindRoot[(1 + FX3[Ka, R, ρ, x0, y0, y]) (Ka - y) y ρ + R2 - y0 == 0, {y,  $\frac{3 * R}{2}}$ ]]
  (* Function to find when Π becomes inadmissible *)

YMaxN[Ka_, R_, ρ_, x0_, y0_] :=
  y /. FindRoot[x0 +  $\frac{1}{\rho} \left( \text{Log} \left[ \left( \frac{y}{y0} \right)^R \left( \frac{Ka - y}{Ka - y0} \right)^{Ka - R} \right] \right) == 0, {y, 2 * R}]
  (* Function to find at what 'time' (immune size) when x becomes extinct *)$ 
```

```

YMaxG2[Ka_, R_, R2_, ρ_, x0_, y0_] :=
  Min[YMaxGN[Ka, R, R2, ρ, x0, y0], YMaxN[Ka, R, ρ, x0, y0]]
(* Calculating what event happens first - emergence becomes impossible,
or first parasite becomes extinct *)

PEmerB[Ka_, R_, R2_, ρ_, x0_, y0_, μ_, yM_] := 1 - Exp[-μ *

Supplementary Material S3: Mathematical analysis of analytical solution

Comparing models with and without feedbacks

1) Comparing this model to one not assuming feedbacks affecting emergence probability

First, we redefine the system of numerical equations to be solved, to create a solution using a 'naive' estimate of emergence probability.

$$Y_{FixG1N}[R2_] := \left(1 - \frac{1}{R2}\right)$$

$$PEmerBN[Ka_ , R_ , R2_ , \rho_ , x0_ , y0_ , \mu_ , yM_] := 1 - \text{Exp}[-\mu * N\text{Integrate}[FX3[Ka, R, \rho, x0, y0, y] * Y_{FixG1N}[R2], \{y, y0, yM\}]]$$

$$PEmerBN2[Ka_ , R_ , R2_ , \rho_ , x0_ , y0_ , \mu_] := \left(1 - \text{Exp}\left[-2 \frac{(R - y0)}{R + y0}\right]\right) * PEmerBN[Ka, R, R2, \rho, x0, y0, \mu, Y_{MaxN}[Ka, R, \rho, x0, y0]]$$

The ratio function below compares the current model estimate to the naive solution that does not consider epidemiological feedbacks. Irrespective of the parameters used, one sees that the naive estimate (no feedbacks) greatly underestimates actual emergence probability.

$$\text{Ratio}[Ka_ , R_ , R2_ , \rho_ , x0_ , y0_ , \mu_] := \frac{PEmerB2[Ka, R, R2, \rho, x0, y0, \mu]}{PEmerBN2[Ka, R, R2, \rho, x0, y0, \mu]}$$

```
Plot3D[Ratio[1000, 50, R2, 5, 1, 20,  $\mu$ ], {R2, 1100, 1200}, { $\mu$ , 0.000001, 0.001}]
```

```
Plot3D[Ratio[100, 60, R2, 5, 1, 20,  $\mu$ ], {R2, 120, 200}, { $\mu$ , 0.000001, 0.001}, AxesLabel → Automatic]
```

2) Comparing this model to one assuming feedbacks up to emergence only

Redefining the system of numerical equations to be solved, creating a solution that only considers feedbacks restricting emergence probability up to the point when the mutated parasite appears.

$$YFixG1M[R2_ , y_] := \left(1 - \text{Exp} \left[- \frac{2 (R2 - y)}{R2 + y} \right] \right)$$

$$PEmerBM[Ka_ , R_ , R2_ , \rho_ , x0_ , y0_ , \mu_ , yM_] := 1 - \text{Exp}[-\mu * N\text{Integrate}[FX3[Ka, R, \rho, x0, y0, y] * YFixG1M[R2, y], \{y, y0, yM\}]]$$

$$YMaxG2M[Ka_ , R_ , R2_ , \rho_ , x0_ , y0_] := \text{Min}[R2, YMaxN[Ka, R, \rho, x0, y0]]$$

$$PEmerBM2[Ka_ , R_ , R2_ , \rho_ , x0_ , y0_ , \mu_] := \left(1 - \text{Exp} \left[- 2 \frac{(R - y0)}{R + y0} \right] \right) * PEmerBM[Ka, R, R2, \rho, x0, y0, \mu, YMaxG2M[Ka, R, R2, \rho, x0, y0]]$$

$$\text{Ratio2}[Ka_ , R_ , R2_ , \rho_ , x0_ , y0_ , \mu_] := \frac{PEmerB2[Ka, R, R2, \rho, x0, y0, \mu]}{PEmerBM2[Ka, R, R2, \rho, x0, y0, \mu]}$$

Again, irrespective of parameters used, this value still greatly underestimates the emergence probability accounting for immune feedbacks.

```
Plot3D[Ratio2[1000, 50, R2, 5, 1, 20,  $\mu$ ], {R2, 1100, 1200}, { $\mu$ , 0.000001, 0.001}]
```

What effects emergence – increasing growth rate (ϕ) or tolerating immunity (increased σ)?

Scaling arguments of the initial model

Where there are two strains present, the unscaled form of dx_2/dy is equal to:

$$\frac{x_2 (\phi - y \sigma)}{r (x_1 + x_2) \left(1 - \frac{y}{K_a}\right) y} // \text{Simplify}$$

$$\frac{K_a x_2 (-y \sigma + \phi)}{r (x_1 + x_2) (K_a - y) y}$$

If we make the substitution $\phi \rightarrow \phi * c$ (so changing ϕ by a constant, c):

$$\frac{K_a x_2 (-y \sigma + \phi)}{r (x_1 + x_2) (K_a - y) y} /. \{\phi \rightarrow \phi * c\}$$

$$\frac{K_a x_2 (-y \sigma + c \phi)}{r (x_1 + x_2) (K_a - y) y}$$

Then making the further substitutions for R, ρ :

$$\frac{K_a x_2 (-y \sigma + c \phi)}{r (x_1 + x_2) (K_a - y) y} /. \{\phi \rightarrow R \sigma\} // \text{FullSimplify}$$

$$\frac{K_a x_2 (c R - y) \sigma}{r (x_1 + x_2) (K_a - y) y}$$

$$\frac{\text{Ka x2 (c R - y) } \sigma}{\text{r (x1 + x2) (Ka - y) y}} \text{ /. \{r \to \rho \sigma1\} // FullSimplify}$$

$$\frac{\text{Ka x2 (c R - y) } \sigma}{(\text{x1 + x2) (Ka - y) y } \rho \sigma1}$$

We can re-write this form as:

$$\frac{\text{Ka x2 (c R - y)}}{(\text{x1 + x2) (Ka - y) y } \rho} \left(\frac{\sigma}{\sigma1} \right) - \left\{ \frac{\text{Ka x2 (c R - y) } \sigma}{(\text{x1 + x2) (Ka - y) y } \rho \sigma1} \right\} // \text{Simplify}$$

$$\{0\}$$

Alternatively, one can instead scale $\sigma \rightarrow \sigma / c$, and make substitutions accordingly:

$$\frac{\text{Ka x2 (-y } \sigma + \phi)}{\text{r (x1 + x2) (Ka - y) y}} \text{ /. \{\sigma \to \sigma / c\}}$$

$$\frac{\text{Ka x2 } \left(-\frac{y \sigma}{c} + \phi\right)}{\text{r (x1 + x2) (Ka - y) y}}$$

$$\frac{\text{Ka x2 } \left(-\frac{y \sigma}{c} + \phi\right)}{\text{r (x1 + x2) (Ka - y) y}} \text{ /. \{\phi \to R \sigma\} // FullSimplify}$$

$$\frac{\text{Ka x2 } \left(R - \frac{y}{c}\right) \sigma}{\text{r (x1 + x2) (Ka - y) y}}$$

$$\frac{\text{Ka x2 } \left(R - \frac{y}{c}\right) \sigma}{\text{r (x1 + x2) (Ka - y) y}} \text{ /. \{r \to \rho \sigma1\} // FullSimplify}$$

$$\frac{\text{Ka x2 } \left(R - \frac{y}{c}\right) \sigma}{(\text{x1 + x2) (Ka - y) y } \rho \sigma1}$$

This scaled form can be rewritten as:

$$\frac{\text{Ka x2 (c R - y)}}{(\text{x1 + x2) (Ka - y) y } \rho c} \left(\frac{\sigma}{\sigma1} \right) - \left\{ \frac{\text{Ka x2 } \left(R - \frac{y}{c}\right) \sigma}{(\text{x1 + x2) (Ka - y) y } \rho \sigma1} \right\} // \text{Simplify}$$

$$\{0\}$$

As explained in the main manuscript, these scaling arguments show how scaling down σ appears to have a larger negative impact on emergence probability (assuming $\sigma = \sigma1$). Therefore it would be more beneficial for the growth rate ϕ to be increased instead. This intuition is verified in the following numerical plots below.

```
YMaxGN[Ka_, R_, R2_, rho_, x0_, y0_] :=
  Floor[y /. FindRoot[(1 + FX3[Ka, R, rho, x0, y0, y]) (Ka - y) y rho + R2 == 0, {y, 2 * R}]]

YMaxN[Ka_, R_, rho_, x0_, y0_] :=
  y /. FindRoot[x0 + 1/rho (Log[(y/y0)^R (Ka - y)/(Ka - y0)^(Ka - R)]) == 0, {y, 2 * R}]
```

```
Plot3D[PEmerB2[1000, 100, R2 * 1.01, 1.01 *  $\rho$ , 1, 20, 0.025] /  
PEmerB2[1000, 100, R2 * 1.01,  $\rho$ , 1, 20, 0.025],  
{ $\rho$ , 0.5, 15}, {R2, 1100, 1200}, AxesLabel  $\rightarrow$  Automatic]
```

```
Plot3D[PEmerB2[1000, 100, R2 * 1, 1.01 *  $\rho$ , 1, 20, 0.025] /  
PEmerB2[1000, 100, R2 * 1,  $\rho$ , 1, 20, 0.025],  
{ $\rho$ , 0.5, 15}, {R2, 1100, 1200}, AxesLabel  $\rightarrow$  Automatic]
```

```
Plot3D[PEmerB2[1000, 60, R2, 0.984 * ρ, 1, 20, 0.0025] /
  PEmerB2[1000, 62, R2, ρ, 1, 20, 0.0025], {ρ, 3, 10}, {R2, 1100, 1200}]
```

Using the immune response from Alizon 2008

We can repeat the above analysis, but instead on an equation that has the following form for $dy/dt = r \phi x y (1 - \frac{y}{K})$. This is the more general immune-response form used in Alizon 2008, assuming that immune proliferation is not just dependent on the presence of a pathogen, but also on its growth rate (see main text for the rationale behind this function).

By increasing ϕ by a constant c , we obtain the following formula:

$$\begin{aligned}
 & \frac{x^2 (\phi - y \sigma)}{r \phi (x_1 + x_2) \left(1 - \frac{y}{K\alpha}\right) y} \quad // \text{Simplify} \\
 & \frac{K\alpha x^2 (-y \sigma + \phi)}{r (x_1 + x_2) (K\alpha - y) y \phi} \\
 & \frac{K\alpha x^2 (-y \sigma + \phi)}{r (x_1 + x_2) (K\alpha - y) y \phi} \quad /. \{\phi \rightarrow \phi * c\} \\
 & \frac{K\alpha x^2 (-y \sigma + c \phi)}{c r (x_1 + x_2) (K\alpha - y) y \phi} \\
 & \frac{K\alpha x^2 (-y \sigma + c \phi)}{c r (x_1 + x_2) (K\alpha - y) y \phi} \quad /. \{\phi \rightarrow R \sigma\} // \text{FullSimplify} \\
 & \frac{K\alpha x^2 (c R - y)}{c r R (x_1 + x_2) (K\alpha - y) y} \\
 & \frac{K\alpha x^2 (c R - y)}{c r R (x_1 + x_2) (K\alpha - y) y} \quad /. \{r \rightarrow \rho \sigma 1\} // \text{FullSimplify} \\
 & \frac{K\alpha x^2 (c R - y)}{c R (x_1 + x_2) (K\alpha - y) y \rho \sigma 1}
 \end{aligned}$$

We can rewrite this as, giving Equation 14 in the main text:

$$\frac{\text{Ka} (\text{c R} - \text{y})}{\text{c } \rho \text{ R y} (\text{Ka} - \text{y}) \sigma 1} \left(\frac{\text{x2}}{\text{x1} + \text{x2}} \right) - \left\{ \frac{\text{Ka x2} (\text{c R} - \text{y})}{\text{c R} (\text{x1} + \text{x2}) (\text{Ka} - \text{y}) \text{y } \rho \sigma 1} \right\} // \text{Simplify}$$

$$\{0\}$$

Alternatively, we can scale $\sigma \rightarrow \sigma/c$ as before:

$$\frac{\text{Ka x2} (-\text{y } \sigma + \phi)}{\text{r} (\text{x1} + \text{x2}) (\text{Ka} - \text{y}) \text{y } \phi} /. \{\sigma \rightarrow \sigma / \text{c}\}$$

$$\frac{\text{Ka x2} \left(-\frac{\text{y } \sigma}{\text{c}} + \phi\right)}{\text{r} (\text{x1} + \text{x2}) (\text{Ka} - \text{y}) \text{y } \phi}$$

$$\frac{\text{Ka x2} \left(-\frac{\text{y } \sigma}{\text{c}} + \phi\right)}{\text{r} (\text{x1} + \text{x2}) (\text{Ka} - \text{y}) \text{y } \phi} /. \{\phi \rightarrow \text{R } \sigma\} // \text{FullSimplify}$$

$$\frac{\text{Ka x2} (\text{c R} - \text{y})}{\text{c r R} (\text{x1} + \text{x2}) (\text{Ka} - \text{y}) \text{y}}$$

$$\frac{\text{Ka x2} (\text{c R} - \text{y})}{\text{c r R} (\text{x1} + \text{x2}) (\text{Ka} - \text{y}) \text{y}} /. \{\text{r} \rightarrow \rho \sigma 1\} // \text{FullSimplify}$$

$$\frac{\text{Ka x2} (\text{c R} - \text{y})}{\text{c R} (\text{x1} + \text{x2}) (\text{Ka} - \text{y}) \text{y } \rho \sigma 1}$$

After simplifying, we see that this term is also equal to Equation 14 in the main text:

$$\frac{\text{Ka} (\text{c R} - \text{y})}{\text{c } \rho \text{ R y} (\text{Ka} - \text{y}) \sigma 1} \left(\frac{\text{x2}}{\text{x1} + \text{x2}} \right) - \left\{ \frac{\text{Ka x2} (\text{c R} - \text{y})}{\text{c R} (\text{x1} + \text{x2}) (\text{Ka} - \text{y}) \text{y } \rho \sigma 1} \right\} // \text{Simplify}$$

To test whether this alternative immune response will lead to different outcomes concerning increasing growth against tolerance, we rederive the system of equations as above, but using Alizon's (2008) immune function instead.

First, we rederive $x[y]$ by solving dx/dy when there is one strain:

$$\text{DSolve}\left[\left\{x'[y] == \frac{\text{Ka} (\text{R} - \text{y})}{\text{R} (\text{Ka} - \text{y}) \text{y } \rho \sigma}, x[y0] == x0\right\}, x[y], y\right] // \text{Simplify}$$

$$\left\{\left\{x[y] \rightarrow \frac{1}{\text{R } \rho \sigma} (\text{R } x0 \rho \sigma + \text{R Log}[y] + (\text{Ka} - \text{R}) \text{Log}[-\text{Ka} + y] - \text{R Log}[y0] - \text{Ka Log}[-\text{Ka} + y0] + \text{R Log}[-\text{Ka} + y0])\right\}\right\}$$

This long solution can be simplified to:

$$x0 + \frac{1}{\text{R } \rho \sigma} \left(\text{Log}\left[\left(\frac{y}{y0}\right)^{\text{R}} \left(\frac{\text{Ka} - y}{\text{Ka} - y0}\right)^{\text{Ka} - \text{R}}\right] \right)$$

We check this by differentiating it and noting that it is equivalent to the original differential equation term:

$$\text{D}\left[x0 + \frac{1}{\text{R } \rho \sigma} \left(\text{Log}\left[\left(\frac{y}{y0}\right)^{\text{R}} \left(\frac{\text{Ka} - y}{\text{Ka} - y0}\right)^{\text{Ka} - \text{R}}\right] \right), y\right] // \text{FullSimplify}$$

$$\frac{\text{Ka R} - \text{Ka y}}{\text{Ka R y } \rho \sigma - \text{R y}^2 \rho \sigma} - \left\{ \frac{\text{Ka} (\text{R} - \text{y})}{\text{R} (\text{Ka} - \text{y}) \text{y } \rho \sigma} \right\} // \text{Simplify}$$

$$\{0\}$$

Therefore, rewriting the system of equations as follows:

```

FX3a[Ka_, R_, ρ_, σ_, x0_, y0_, y_] := x0 +  $\frac{1}{R \rho \sigma} \left( \text{Log} \left[ \left( \frac{y}{y0} \right)^R \left( \frac{Ka - y}{Ka - y0} \right)^{Ka-R} \right] \right)$ 

YFixG1X[Ka_, R_, R2_, ρ_, σ_, x0_, y0_, y_] :=
  ((R2 - y0) / ((1 + FX3a[Ka, R, ρ, σ, x0, y0, y]) (Ka - y) R y ρ σ + R2 - y0))
  (1 - Exp[- $\frac{2 (R2 - y)}{R2 + y}$ ])

YMaxGN[Ka_, R_, R2_, ρ_, σ_, x0_, y0_] := Floor[
  y /. FindRoot[(1 + FX3a[Ka, R, ρ, σ, x0, y0, y]) (Ka - y) R y ρ σ + R2 - y0 == 0, {y,  $\frac{2 Ka}{3}}$ ]]

YMaxN[Ka_, R_, ρ_, σ_, x0_, y0_] :=
  y /. FindRoot[( $x0 + \frac{1}{R \rho \sigma} \left( \text{Log} \left[ \left( \frac{y}{y0} \right)^R \left( \frac{Ka - y}{Ka - y0} \right)^{Ka-R} \right] \right)$ ) == 0, {y,  $\frac{2 Ka}{3}}$ ]

YMaxG2[Ka_, R_, R2_, ρ_, σ_, x0_, y0_] :=
  Min[YMaxGN[Ka, R, R2, ρ, σ, x0, y0], YMaxN[Ka, R, ρ, σ, x0, y0]]

PEmerB[Ka_, R_, R2_, ρ_, σ_, x0_, y0_, μ_, yM_] :=
  1 - Exp[-μ * NIntegrate[FX3a[Ka, R, ρ, σ, x0, y0, y] *
    YFixG1X[Ka, R, R2, ρ, σ, x0, y0, y], {y, y0, yM}]]

PEmerB2[Ka_, R_, R2_, ρ_, σ_, x0_, y0_, μ_] := (1 - Exp[-2  $\frac{(R - y0)}{R + y0}$ ]) *
  PEmerB[Ka, R, R2, ρ, σ, x0, y0, μ, YMaxG2[Ka, R, R2, ρ, σ, x0, y0]]

```

Comparing increased tolerance against increase growth shows that increased growth performs better in terms of emergence probability, as explained in the main text.

```

Plot3D[ $\frac{\text{PEmerB2}[1000, 100, R2 * 1.01, 1.01 * \rho, 1, 1, 20, 0.025]}{\text{PEmerB2}[1000, 100, R2 * 1.01, \rho, 1, 1, 20, 0.025]}$ ,
  {ρ, 2, 15}, {R2, 1100, 1200}, AxesLabel -> Automatic]

```
