

Log Scores vs. Season Week at Analysis Time

S4 Fig. Log scores achieved by each component model in each week of the season. For each week of the season, log scores are summarized across all seasons in the training phase when all three component models produced predictions. The thick line is a smoothed estimate of mean log score at each week in the season; the shaded region indicates the convex hull of log scores achieved by each model; and the actual log scores achieved in each week are indicated with points.
