Figure S8

The figure shows the percentage of mt (mitochondria) connectivity under different conditions. The x-axis represents two treatments: vec(RNAi) and fzo-1(RNAi). The y-axis represents the percentage connectivity ranging from 0 to 100.

The data is divided into three categories: Low, Med, and High. The bar graph indicates that under vec(RNAi), the connectivity is predominantly in the Low category, with a small portion in the Med category. Under fzo-1(RNAi), the connectivity is distributed more evenly across the Low, Med, and High categories.
