

Figure S4. Kaplan–Meier Survival Plots of Recurrence Free Survival of Patients with early HCC stratified by RS65.

Patients with early stage HCC (Barcelona Clinic Liver Cancer [BCLC] stage 0 and A) (n=290) were stratified by the 65-gene risk score. Patients with very early recurrence (<1 year) are plotted in left panels, those with intermediate recurrence (1 to 2 years) in middle panels, and those with late recurrence (>2 years) in right panels. *P* values were obtained from the log-rank test. The + symbol denotes observations that were censored owing to loss to follow-up or on the date of the last contact.
