Figure S1. *Plasmodium vivax*’s presence in the immediate surrounding region of Parque Estadual da Ilha do Cardoso. Curado and others [1] has found positivity of IgG antibodies against *P. vivax* in human samples from Iporanga municipality (prevalence ~ 50%). Castro Duarte and others [2] detected *Plasmodium vivax* infections in howler-monkeys (i.e., *Alouatta guariba clamitans*) from the Atlantic Forest (possibly Juquitiba municipality) (prevalence ~ 6%). Finally, D’Avila Couto and others [3] estimated that near 400 cases of malaria (being 97.2 % attributable to *P. vivax*) were confirmed between 1980 and 2007 by official agencies of epidemiological surveillance (e.g., Superintendência de Controle de Endemias da Secretaria de Estado da Saúde de São Paulo and Sistema de Informação de Agravos de Notificação).
