Fig 5. Phenotype of LSEC from normal and DIO mice. (A) Primary LSEC (CD45⁺CD146⁺) isolated from normal C57Bl/6 lean mice were analyzed for CD146 and Stabilin-2 expression and uptake of Dil-labeled Ac-LDL by flow cytometry. (B) Scanning electron microscopy of fenestrae (arrows) in LSEC directly isolated from C57Bl/6 mice cultured with and without 10ng/ml VEGF (5000x). (C) Primary LSEC isolated from C57Bl/6 lean mice were cultured with the indicated FFA for 24hours. CCL2 levels in the supernatant were measured by ELISA. Graphs represent the mean $\pm$ SE from 3 mice. Primary LSEC (CD45⁺CD146⁺) (D) and LSEC depleted non-parenchymal cells (CD45⁺CD146⁻) (E) were isolated from mice fed a low fat diet (NCD) and obese mice fed a high fat diet (HFD) for 12 weeks and gene expression for chemokines was evaluated by quantitative qPCR. Graphs represent the mean $\pm$ SE from 5–7 mice. * $p < 0.05$
