Supplemental Material for:
Rheostats and toggle switches for modulating protein function
File 3: Beta-galactosidase reporter gene assays
Meinhardt, Manley, Parente and Swint-Kruse

List of Figures

S1 Beta-galactosidase reporter gene assay: Position 46 ................................. 3
S2 Beta-galactosidase reporter gene assay: Position 48 .................................. 4
S3 Beta-galactosidase reporter gene assay: Position 50 .................................. 5
S4 Beta-galactosidase reporter gene assay: Position 51 .................................. 6
S5 Beta-galactosidase reporter gene assay: Position 52 .................................. 7
S6 Beta-galactosidase reporter gene assay: Position 54 .................................. 8
S7 Beta-galactosidase reporter gene assay: Position 55 .................................. 9
S8 Beta-galactosidase reporter gene assay: Position 58 .................................. 10
S9 Beta-galactosidase reporter gene assay: Position 59 .................................. 11
S10 Beta-galactosidase reporter gene assay: Position 60 ................................ 12
S11 Beta-galactosidase reporter gene assay: Position 61 ................................ 13
S12 Beta-galactosidase reporter gene assay: Position 62 ................................ 14
Figures S1-S12. These plots show results from $\beta$-galactosidase (lacZ) reporter gene assays for >1000 variants of the LacI/GalR chimeras and LacI-11. Lower values correspond to tighter repression of the lac operon. The first bar in each graph is labeled DEL (black) and shows $\beta$-galactosidase activity in the absence of repressor protein. Below 13 Miller units (solid black line), any change in repression altered bacterial growth [17]. The red dashed lines indicate the activities of un-mutated, starting proteins. Note that some red lines obscure the black lines in some panels. Error bars are the standard deviation of 2-4 independent bacterial colonies, each in quadruplicate or duplicate. All variants showed expressed and active protein in vivo, as assessed by the DNA pull-down assay.

In Figures S1-12, data are organized to show all variants at a given position (e.g. position 46) in all mutated proteins on one page. Assays were carried out in the absence and presence of allosteric effectors [17]. For all inducible repressors, the front colored series shows repression in the absence of effector and the back gray series show repression in the presence effector. For the co-repressible chimeras based on PurR (LLhP, LPhP57cs, LGhP), the front series shows repression in the presence of effector and the back series shows repression in the absence. LLhA variants have no known allosteric effectors.

Exceptions to the general description: (1) Values for the LLhA/Q55A variants R51L, R51M, and V52L were only determined from one days assay (2 colonies each in duplicate). (2) The LGhG variants H48I and H48N are not shown on the following plots but had white phenotypes (tight repression) in plate assays. In liquid culture assays, these variants appeared to be toxic to *E. coli*. Plate assays results were taken into consideration when assigning rheostat behavior to position 48 in LGhG (Table 4 in the main document).
