Figure S4. Occurrence of the NMR interface in membranes with native composition of fatty acids

For all ten simulations performed in the membrane containing A. a native composition of fatty acids fused to the PC head group and cholesterol (nFA+CHOL) B. a native composition of fatty acids fused to the PC head group but missing cholesterol (nFA) C. a native composition of fatty acids fused to native head groups (nFA+head) the presences of the NMR interface is plotted for each time point in grey.
