S1 Results. Breeding Efficacy, Gender, and Genotype Ratio. Table S4 shows the number of litters and breeding efficacy of the two models. Sex and genotype ratios were unbiased in both models. Animals in cohort 1 were weaned at 4 weeks of age due to small body size. The second cohort was weaned at 3 weeks of age in preparation for P30 testing. Breeding success and pup survival was higher in the mixed genetic background (Table_S4).
