S5 Figure. A putative chromone C-glucoside from *E. gregsoniana* glands observed with *m/z* 355 [M+H]⁺ using ESI-LCMS/MS in positive mode. The characteristic multi-fragment array of C-glucosides was observed including an abundant fragment with a neutral loss of 120 Da (*m/z* 235) and relatively less abundant fragment with a loss of 150 Da (*m/z* 205). Similarly characteristic of C-glucosides is the very low abundance of the aglycone fragment with *m/z* 193 [M+H]⁺ exhibiting a neutral loss of 162 Da (glucose).
