S4 Fig. Increased myelopoiesis in recipients of unfractionated Crebbp +/- BM who did not develop early-onset AML. Presented are the average percent ± SD of Gr1+Mac1+ (G'M'), Gr1loMac1+ (GloM') and total myeloid cells in CD45.2+, donor-derived cells in the BM (upper), PB (middle) and spleen (bottom) of wild-type controls (black bars; n=10) and recipients of unfractionated Crebbp +/- BM cells. The latter group was divided in two subgroups based on the absence (group 1, white bars, n=5) or presence of thrombocytosis (group 2, gray bars, n=4).
