S6 Appendix. The choice of the most likely number of clusters (K) inferred from multilocus microsatellite data using a model-based clustering method of Pritchard et al. (2000): ln P(X|K) values for each of the ten independent runs for each K and ΔK values for each K (shown on logarithmic scale) based on the second order rate of change of the likelihood function with respect to K described by Evanno et al. (2005).
