Study Type: Interventional
Study Design: Treatment, Parallel Assignment, Open Label, Randomized, N/A
Official Title: H-SENSES PROJECT Self Care Mediated by the Senses: Assessing the Impact on Self-esteem, Stress and Well-being of Female Health Professionals.

Further study details as provided by Eliseth Ribeiro Leao, Hospital Israelita Albert Einstein:

Primary Outcome Measure:
- Change in perceived stress [Time Frame: baseline, 30 days, 60 days] [Designated as safety issue: No]
Lipp Stress Inventory and Symptoms of Stress List

Secondary Outcome Measures:
- Change in cortisol levels  [Time Frame: baseline, 30 days, 60 days] [Designated as safety issue: No]
  Saliva will be collected to measure cortisol levels: 7-9 am

Other Pre-specified Outcome Measures:
- Changes in Satisfaction with life  [Time Frame: baseline, 30 days, 60 days] [Designated as safety issue: No]
  Satisfaction With Life Scale
- Changes in Positive and Negative Affective  [Time Frame: baseline, 30 days, 60 days] [Designated as safety issue: No]
  Positive and negative affect scale
- Change in perceived self-esteem  [Time Frame: baseline, 30 days, 60 days] [Designated as safety issue: No]
  Rosenberg's self-esteem Scale

Estimated Enrollment: 240
Study Start Date: July 2014
Estimated Study Completion Date: March 2015
Primary Completion Date: October 2014

The work environment of health professionals is commonly considered stressful, given that they need to deal with difficult situations that include pain, risk of death, the decisions that need to be fast and accurate, and conflicts generated in interpersonal relationships. There is an ongoing discussion that we need to care for those who care, however, there are few interventions studied and validated to effectively reduce the stress of these professionals that resonate in states of well-being. There is little room for discussion of this topic during the workday, as well as to learn techniques and measures for effective stress management. This study aims to explore the relationship between well-being, self-esteem and stress of women health professionals, and compare three self-care interventions mediated by the senses.

Eligibility

Ages Eligible for Study: 18 Years to 60 Years
Genders Eligible for Study: Female
Accepts healthy volunteers.

Inclusion Criteria:

- Professional healthcare;
- working in healthcare or administrative area in hospital
- Voluntary participation;
- Signed in term of free and informed consent.

Exclusion Criteria:

- Evaluation with relevant dermatological findings diagnosed by a dermatologist;
- Work at nighttime or in alternate periods (because of known chronobiological changes that would affect the study of cortisol, one of the outcomes considered in the study);
- who are breastfeeding;
- Be pregnant
