S5 Fig. Cigarettes per day. Inputs for cigarettes per day, by age (0-99) and year of birth, were adapted to values from the literature on smoking intensity in China (Chen 2015; Ng 2015; Qian 2010). In the paper by Chen et al., values for cigarettes per day are given for five different ages in the year 2006; these five values were extrapolated into a smooth curve for ages 20-100 (red) and our model was adapted to these values (gray).
