S2 Fig.: Concentrations of selected metabolites contained in metabolite patterns important for prediction of age in male study participants versus age. Plots are shown for (A) plasma and (B) urine metabolites of male study participants with mean rank 1 (left panel) and 25 (right panel). PO4, phosphate; U2.50, unknown NMR analyte at 2.5 ppm; 4-HMA, 4-hydroxymandelic acid; a.u., arbitrary units.
