S2 Fig. PaeM4 and PaeM4H liquid culture killing assay. *P. aeruginosa* strain A19 was cultivated in CAA medium, treated by 5 or 50 µg mL⁻¹ of pyocins and incubated with shaking for 6.5 hours. The antimicrobial activity of pyocins was evaluated by determining cell numbers of bacterial test culture. 10, 10⁻¹, 10⁻², 10⁻³, 10⁻⁴, 10⁻⁵ dilutions were made, plated on LB agar plates, incubated overnight at 37 °C and CFU calculated. Data are the mean ± SD of two independent experiments.
