S2 Fig. Circulating B cells in invasive cancer patients and control subjects. PBMCs isolated from both invasive cervical cancer patients or age matched control subjects were labeled with anti-CD19, anti-CD38, anti-CD21, anti-CD27, anti-IgD, anti-IgM and analyzed by flow cytometry. The graphs show the percentage of CD19+ in the total population, and the percentage of naïve and memory cells within the CD19+ population. Naïve phenotype was defined as CD19+CD27-IgD+ and memory as CD19+CD27+IgD CD38+.
