S4 Fig. Flow cytometric analysis of intracellular staining analysis for Gag p24-specific IL-2, TNFα and IFNγ-producing CD4+ and CD8+ T cells. Cryopreserved cells were stimulated with peptide pools (2 µg/ml) in the presence of Brefeldin A for 6 h. Intracellular cytokine staining was performed (see Methods) and analyzed by flow cytometry. Upper two panels are CD4+ T cells and the lower two panels are CD8+ T cells. The annotated quadrants indicate the gates used to quantify % cytokine positive cells.
