S5 Fig: Mycobacterial alpha diversity between controls (blue) and cases (orange). X-axis = study group, Y-axis = diversity index value. Shannon Index ($P = 0.05$) and Pielou’s Evenness Index ($P = 0.028$) were significantly lower in cases; there was no significant difference in Observed richness ($P = 0.166$) or Inverse Simpson’s Index ($P = 0.109$).
