## Exploratory statistical analyses of Belief in a Just World data - part of which

 support Step 1 (i.e., combination of online and lab data)Alwin Stegeman

Data received on January 28, 2013.
7 items with scores 1,2,3,4,5,6,7
6 actors: Nature, God, Human Institutions, Other People, Yourself, Chance
2 perspectives: for Other People, for Yourself
study 1: USlab data (students, $\mathrm{N}=109$ after deleting subjects with missing data) study 2: Mturk data (online volunteers, $\mathrm{N}=236$ after deleting subjects with missing data)

## Descriptive Statistics: means, standard deviations, frequencies

Table: means and standard deviations per actor, perspective, and study, for all items together.

|  | Others (study 1) | Yourself (study 1) | Others (study 2) | Yourself (study 2) |
| :--- | :---: | :---: | :---: | :---: |
| Nature | 3.20 | 3.23 | 3.06 | 2.92 |
|  | $(1.71)$ | $(1.72)$ | $(1.76)$ | $(1.81)$ |
| God | 3.17 | 3.21 | 3.92 | 3.76 |
|  | $(2.04)$ | $(2.08)$ | $(2.21)$ | $(2.28)$ |
| Institutions | 4.12 | 4.20 | 4.09 | 3.89 |
|  | $(1.35)$ | $(1.36)$ | $(1.42)$ | $(1.51)$ |
| Other People | 4.36 | 4.48 | 4.21 | 4.06 |
|  | $(1.35)$ | $(1.31)$ | $(1.37)$ | $(1.53)$ |
| Yourself | 4.56 | 4.62 | 4.22 | 4.29 |
|  | $(1.44)$ | $(1.50)$ | $(1.58)$ | $(1.68)$ |
| Chance | 3.74 | 3.62 | 3.68 | 3.63 |
|  | $(1.53)$ | $(1.53)$ | $(1.70)$ | $(1.76)$ |

Remarks:

- In study 1 the means are generally larger for Yourself than for Others, while the converse is true in study 2 (due to the self-confidence of youth?).
- Standard deviations are larger for study 2 than for study 1 ( 80 of 84 items), probably due to less homogenous sample (larger age range, not all with academic background).
- Standard deviations are larger for Yourself than for Others for study 2 (39 of 42 items) but not for study 1 ( 24 of 42 items).
- Standard deviations are largest for God in both perspectives and studies, perhaps due to differences in ideas about 'God'.

| study 1 | item 1 | item 2 | item 3 | item 4 | item 5 | item 6 | item 7 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |

| answer 6 | 364 | 386 | 379 | 367 | 319 | 309 | 365 |
| answer 7 | 172 | 187 | 174 | 171 | 188 | 161 | 200 |

Table: Frequencies of answers for each item, for all actors and perspectives together.

Remark:

- Although frequencies of answer 7 are considerably lower than the rest, they are not low enough to consider merging answering categories 6 and 7.

## Preliminary analysis of item correlations

| study 1 | item 1 | item 2 | item 3 | item 4 | item 5 | item 6 | item 7 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| item 1 | 1 | 0.74 | 0.76 | 0.74 | 0.70 | 0.70 | 0.57 |
| item 2 | 0.79 | 1 | 0.80 | 0.75 | 0.76 | 0.77 | 0.60 |
| item 3 | 0.74 | 0.76 | 1 | 0.77 | 0.74 | 0.79 | 0.60 |
| item 4 | 0.76 | 0.73 | 0.78 | 1 | 0.75 | 0.75 | 0.61 |
| item 5 | 0.72 | 0.70 | 0.77 | 0.74 | 1 | 0.83 | 0.70 |
| item 6 | 0.75 | 0.75 | 0.83 | 0.78 | 0.85 | 1 | 0.70 |
| item 7 | 0.66 | 0.65 | 0.69 | 0.67 | 0.71 | 0.78 | 1 |
|  |  |  |  |  |  |  |  |
| study 2 | item 1 | item 2 | item 3 | item 4 | item 5 | item 6 | item 7 |
| item 1 | 1 | 0.77 | 0.78 | 0.75 | 0.75 | 0.74 | 0.64 |
| item 2 | 0.76 | 1 | 0.82 | 0.76 | 0.75 | 0.75 | 0.63 |
| item 3 | 0.80 | 0.81 | 1 | 0.79 | 0.79 | 0.80 | 0.65 |
| item 4 | 0.78 | 0.75 | 0.80 | 1 | 0.78 | 0.79 | 0.62 |
| item 5 | 0.78 | 0.76 | 0.79 | 0.77 | 1 | 0.83 | 0.68 |
| item 6 | 0.75 | 0.77 | 0.81 | 0.78 | 0.82 | 1 | 0.71 |
| item 7 | 0.67 | 0.71 | 0.66 | 0.67 | 0.68 | 0.72 | 1 |

Table: Item correlations for all actors together, and perspectives for Others (above the diagonal) and for Yourself (below the diagonal).

Remark:

- All items are highly correlated (with item 7 slightly lower) in both studies.

| study 1 | Nature | God | Institutions | Other People | Yourself | Chance |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: |
| Nature | 1 | 0.36 | 0.23 | 0.24 | 0.20 | 0.29 |
| God | 0.20 | 1 | 0.01 | -0.09 | -0.00 | -0.12 |
| Institutions | 0.27 | 0.02 | 1 | 0.65 | 0.26 | 0.16 |
| Other People | 0.14 | -0.16 | 0.66 | 1 | 0.29 | 0.31 |
| Yourself | 0.09 | -0.06 | 0.14 | 0.20 | 1 | 0.15 |
| Chance | 0.36 | -0.17 | 0.23 | 0.30 | 0.12 | 1 |
|  |  |  |  |  |  |  |
| study 2 | Nature | God | Institutions | Other People | Yourself | Chance |
| Nature | 1 | 0.34 | 0.31 | 0.29 | 0.19 | 0.33 |
| God | 0.26 | 1 | 0.09 | 0.02 | -0.05 | -0.10 |
| Institutions | 0.29 | 0.07 | 1 | 0.71 | 0.35 | 0.22 |
| Other People | 0.34 | 0.03 | 0.73 | 1 | 0.38 | 0.25 |
| Yourself | 0.18 | -0.15 | 0.25 | 0.23 | 1 | 0.25 |
| Chance | 0.38 | -0.13 | 0.20 | 0.22 | 0.25 | 1 |

Table: Correlations among actors for all items together, and perspectives for Others (above the diagonal) and for Yourself (below the diagonal).

Remark:

- In both studies, the actor correlations are fairly low except between Human Institutions and Other People.

## T-tests to compare means for the two perspectives

We do a paired sample t -test for each item and actor separately for the two studies. Hence, we obtain 42 t -values for each study.

| study 1 | item 1 | item 2 | item 3 | item 4 | item 5 | item 6 | item 7 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Nature | 0.48 | 0.28 | 0.19 | 1.39 | 0.39 | -1.44 | $\mathbf{- 2 . 9 1}$ |
| God | -0.07 | 0.19 | -0.47 | 0.21 | -0.44 | -0.59 | -1.11 |
| Institutions | -0.85 | -0.69 | 0.14 | 0.77 | 1.21 | -0.41 | $\mathbf{- 5 . 1 9}$ |
| Other People | -1.43 | $\mathbf{- 2 . 9 3}$ | 0.26 | 0.00 | $\mathbf{2 . 5 3}$ | 0.17 | $\mathbf{- 5 . 4 6}$ |
| Yourself | 1.69 | 1.07 | 0.14 | 1.38 | $\mathbf{- 2 . 0 9}$ | $\mathbf{- 2 . 0 8}$ | $\mathbf{- 3 . 2 7}$ |
| Chance | 1.19 | 1.16 | $\mathbf{2 . 7 1}$ | $\mathbf{2 . 7 1}$ | 1.21 | 0.53 | $\mathbf{- 1 . 9 7}$ |
|  |  |  |  |  |  |  |  |
| study 2 | item 1 | item 2 | item 3 | item 4 | item 5 | item 6 | item 7 |
| Nature | 1.60 | 1.90 | 1.64 | 0.42 | $\mathbf{2 . 6 9}$ | $\mathbf{3 . 0 4}$ | -0.43 |
| God | 0.85 | $\mathbf{2 . 7 8}$ | $\mathbf{2 . 6 9}$ | 0.66 | $\mathbf{2 . 0 0}$ | 1.10 | 1.54 |
| Institutions | 0.83 | $\mathbf{2 . 7 4}$ | $\mathbf{1 . 9 8}$ | $\mathbf{4 . 2 6}$ | $\mathbf{3 . 8 9}$ | $\mathbf{2 . 8 7}$ | $\mathbf{- 1 . 2 2}$ |
| Other People | 1.37 | 1.81 | 1.73 | $\mathbf{2 . 8 7}$ | $\mathbf{4 . 7 6}$ | 1.23 | $\mathbf{- 2 . 3 6}$ |
| Yourself | -0.18 | -0.85 | $\mathbf{- 1 . 1 0}$ | 0.88 | $\mathbf{- 1 . 8 0}$ | $\mathbf{- 1 . 2 9}$ | $\mathbf{- 1 . 2 9}$ |
| Chance | 0.47 | 1.32 | 0.89 | 0.67 | 1.92 | 0.72 | $\mathbf{- 2 . 0 3}$ |

Table: T-values of paired sample t -tests per item and actor (for Others minus for Yourself), to compare means for the two perspectives. Values in bold are significant at $5 \%$ level (two-sided, critical values are $\pm 1.96$ ).

Remarks:

- There are interesting patterns of large $t$-values (both positive and negative), which are quite different for the two studies. Interpretation is left to the experts ;-)
- Several methods have been proposed to control the family wise error rate in case of multiple comparisons. The simple and conservative Bonferroni correction implies replacing alpha by alpha/42 in our case. This results in critical values $\pm 3.24$ and yields 3 significant $t$-values for study 1 , and also 3 significant $t$-values for study 2 . The Bonferroni-Holm procedure (less conservative) orders the $t$-values and starts the largest in magnitude and alpha/42, where 42 is decreased by one for each null hypothesis that is rejected. This procedure also results in 3 significant t -values for both studies. We conclude that overall the mean differences between the two perspectives are rather small with only 3 out of 42 t -values being significant in both studies.

## T-tests to compare means for the two studies

We do a two-sample t-test for each item and actor and perspective separately. We assume that the variances are equal in the two samples (but this is questionable; see the table on page 1). Hence, we obtain 84 t -values in total.

| for Others | item 1 | item 2 | item 3 | item 4 | item 5 | item 6 | item 7 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Nature | 0.83 | 0.77 | 0.70 | 1.30 | 0.75 | 0.33 | 0.27 |
| God | $\mathbf{- 2 . 9 6}$ | $\mathbf{- 3 . 1 1}$ | $\mathbf{- 3 . 6 1}$ | $\mathbf{- 2 . 4 1}$ | $\mathbf{- 3 . 0 8}$ | $\mathbf{- 2 . 9 0}$ | $\mathbf{- 2 . 8 6}$ |
| Institutions | 0.59 | 0.35 | 0.86 | 0.10 | -0.08 | 0.12 | -0.69 |
| Other People | 1.10 | 0.38 | 1.75 | 1.85 | 0.86 | 1.45 | -0.54 |
| Yourself | $\mathbf{2 . 0 4}$ | 1.73 | $\mathbf{2 . 4 0}$ | $\mathbf{2 . 5 3}$ | 1.77 | 1.61 | 1.36 |
| Chance | 0.79 | -0.44 | 0.17 | 1.14 | -0.23 | 0.20 | 0.49 |
|  |  |  |  |  |  |  |  |
| for Yourself | item 1 | item 2 | item 3 | item 4 | item 5 | item 6 | item 7 |
| Nature | 1.26 | 1.39 | 1.30 | 0.61 | 1.74 | $\mathbf{2 . 3 4}$ | $\mathbf{1 . 9 9}$ |
| God | $\mathbf{- 2 . 4 5}$ | $\mathbf{- 2 . 0 9}$ | $\mathbf{- 2 . 3 4}$ | $\mathbf{- 2 . 1 4}$ | $\mathbf{- 2 . 1 6}$ | $\mathbf{- 2 . 2 0}$ | $\mathbf{- 1 . 7 8}$ |
| Institutions | 1.72 | $\mathbf{2 . 3 7}$ | 1.78 | 1.80 | 1.06 | 1.92 | $\mathbf{2 . 3 2}$ |
| Other People | $\mathbf{2 . 9 6}$ | $\mathbf{3 . 6 1}$ | $\mathbf{2 . 2 8}$ | $\mathbf{3 . 2 8}$ | 1.51 | 1.92 | $\mathbf{2 . 1 4}$ |
| Yourself | 0.43 | 0.39 | 1.68 | 1.94 | $\mathbf{2 . 3 0}$ | $\mathbf{2 . 3 5}$ | $\mathbf{3 . 1 7}$ |
| Chance | 0.23 | $\mathbf{- 0 . 3 9}$ | $\mathbf{- 0 . 9 7}$ | -0.22 | $\mathbf{- 0 . 0 1}$ | 0.28 | 0.85 |

Table: T-values of two-sample t-tests per item and actor and perspective (study 1 minus study 2), to compare means for the two studies. Values in bold are significant at $5 \%$ level (two-sided, critical values are $\pm 1.96$ ).

## Remarks:

- There are interesting patterns of large $t$-values (both positive and negative), which are quite similar for the two perspectives. Interpretation is left to the experts ;-)
- The Bonferroni correction implies replacing alpha by alpha/84 in our case, which results in critical values $\pm 3.43$ and yields 1 significant $t$-value for the Others perspective, and also 1 significant $t$-value for the Yourself perspective. The Bonferroni-Holm procedure also results in 1 significant t -value for both perspectives. We conclude that overall the mean differences between the two studies are rather small with only 2 out of 84 t -values being significant.

## T-tests to compare means for the order of questions in the questionnaire (counterbalancing)

In each study, the order of the questions (order $=1$ for first Others and then Yourself, order=2 for first Yourself and then Others) is varied. The numbers of subjects (without missing data) with the same order of questions are as follows:

$$
\begin{array}{lrr}
\text { study 1: } & \quad 61 \text { with order=1, } & 48 \text { with order=2 } \\
\text { study 2: } & 118 \text { with order=1, } & 118 \text { with order=2 }
\end{array}
$$

We do a two-sample $t$-test for each item and actor and perspective and study. For study 1 , the $t$-values are given in the table below.

| for Others | item 1 | item 2 | item 3 | item 4 | item 5 | item 6 | item 7 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Nature | 0.79 | -1.30 | -1.20 | -1.81 | -1.19 | -1.69 | -0.33 |
| God | -0.85 | -0.83 | -1.47 | -0.87 | -0.77 | -1.57 | -0.16 |
| Institutions | -0.29 | -0.30 | $\mathbf{2 . 2 6}$ | -0.71 | -1.97 | -0.96 | -1.08 |
| Other People | $\mathbf{- 2 . 1 2}$ | -0.49 | -0.31 | -0.56 | -1.05 | -1.06 | -1.70 |
| Yourself | -1.14 | -1.26 | 0.58 | 0.90 | -1.08 | -1.05 | -1.92 |
| Chance | -0.50 | -1.23 | -1.26 | 0.28 | -1.29 | -1.95 | -1.06 |
|  |  |  |  |  |  |  |  |
| for Yourself | item 1 | item 2 | item 3 | item 4 | item 5 | item 6 | item 7 |
| Nature | $\mathbf{- 2 . 1 4}$ | $\mathbf{- 2 . 3 3}$ | -1.46 | -0.86 | -1.61 | -0.88 | 0.55 |
| God | -0.39 | -0.92 | -0.92 | -0.77 | -0.15 | -0.42 | -0.06 |
| Institutions | -0.09 | -0.06 | -0.65 | -0.31 | 1.27 | 0.84 | 0.74 |
| Other People | 0.56 | 0.73 | -0.18 | 0.01 | 0.82 | 0.79 | -0.34 |
| Yourself | -0.38 | -0.38 | 0.27 | -0.55 | -1.12 | -1.45 | -0.77 |
| Chance | -1.13 | -0.54 | -1.19 | 0.63 | -1.38 | -0.79 | -0.46 |

Table: T-values of two-sample t-tests per item and actor and perspective (order=1 minus order $=2$ ), to compare means for the orders of questions for study 1 . Values in bold are significant at $5 \%$ level (two-sided, critical values are $\pm 1.96$ ).

Remark:

- The Bonferroni correction (critical values $\pm 3.43$ ) and the Bonferroni-Holmes procedure both yield no significant t -values out of 84 . We conclude that overall the mean differences between the two orders are not significant for study 1 .

For study 2, the t -values are given in the table below.

| for Others | item 1 | item 2 | item 3 | item 4 | item 5 | item 6 | item 7 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Nature | 0.70 | 1.02 | 0.63 | 0.50 | -0.36 | 0.45 | 0.42 |
| God | $\mathbf{- 2 . 3 7}$ | -1.29 | -1.30 | -1.32 | -0.91 | -1.05 | -0.41 |
| Institutions | 0.83 | 0.38 | 1.11 | 0.69 | -0.44 | 0.58 | 0.40 |
| Other People | 0.48 | 1.31 | 0.97 | 0.10 | -0.09 | 0.27 | 0.52 |
| Yourself | -1.08 | -2.11 | -0.54 | 0.29 | -0.58 | 0.33 | -0.90 |
| Chance | 1.78 | 1.99 | 1.05 | $\mathbf{2 . 3 2}$ | 1.59 | $\mathbf{2 . 1 0}$ | -0.29 |
|  |  |  |  |  |  |  |  |
| for Yourself | item 1 | item 2 | item 3 | item 4 | item 5 | item 6 | item 7 |
| Nature | -1.21 | 0.15 | 0.43 | -0.14 | 0.50 | 0.87 | 0.45 |
| God | -0.54 | -0.51 | -0.26 | -0.57 | -0.14 | -0.66 | -1.03 |
| Institutions | -1.62 | 0.09 | 0.22 | 0.60 | 0.33 | 0.34 | 0.35 |
| Other People | 0.59 | -0.40 | 1.07 | 0.90 | 1.42 | 0.66 | 0.92 |
| Yourself | 1.47 | $\mathbf{2 . 4 2}$ | 1.42 | 1.26 | 0.99 | 0.90 | 1.43 |
| Chance | 0.87 | 0.77 | 0.70 | 1.23 | 0.73 | 1.85 | $\mathbf{2 . 7 4}$ |

Table: T-values of two-sample t -tests per item and actor and perspective (order=1 minus order=2), to compare means for the orders of questions for study 2 . Values in bold are significant at $5 \%$ level (two-sided, critical values are $\pm 1.96$ ).

## Remark:

- The Bonferroni correction (critical values $\pm 3.43$ ) and the Bonferroni-Holmes procedure both yield no significant t -values out of 84 . We conclude that overall the mean differences between the two orders are not significant for study 2.

## Principal Component Analysis (PCA) for the perspectives and studies separately

For each study and each perspective separately, we do a PCA with Varimax rotation (resulting in (hopefully) interpretable orthogonal components) on the correlation matrix with 42 items ( 7 items for each of the 6 actors). Below, we present for each

PCA the SPSS table with explained variances, and a table with rotated loadings. We use 5 components in each PCA. Adding a sixth component yields either a noninterpretable component or a component with small loadings (around 0.4).

| Component | Extraction Sums of Squared Loadings |  |  | Rotation Sums of Squared Loadings |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Total | \% of Variance | Cumulative \% | Total | \% of Variance | Cumulative \% |
| 1 | 11,565 | 27,535 | 27,535 | 7,851 | 18,693 | 18,693 |
| 2 | 8,105 | 19,297 | 46,833 | 6,618 | 15,758 | 34,451 |
| 3 | 4,370 | 10,404 | 57,237 | 5,543 | 13,198 | 47,650 |
| 4 | 3,484 | 8,296 | 65,533 | 4,915 | 11,702 | 59,352 |
| 5 | 2,145 | 5,107 | 70,640 | 4,741 | 11,288 | 70,640 |

Extraction Method: Principal Component Analysis.
a. Only cases for which Study = US lab data (run in the lab) are used in the analysis phase. Perspective: for Others.

Total Variance Explained ${ }^{\text {a }}$

| Component | Extraction Sums of Squared Loadings |  |  | Rotation Sums of Squared Loadings |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Total | \% of Variance | Cumulative \% | Total | \% of Variance | Cumulative \% |
| 1 | 11,594 | 27,605 | 27,605 | 8,000 | 19,047 | 19,047 |
| 2 | 7,662 | 18,242 | 45,847 | 6,868 | 16,353 | 35,400 |

Extraction Method: Principal Component Analysis.
Rotation Method: Varimax with Kaiser Normalization.
a. Rotation converged in 6 iterations.
b. Only cases for which Study = M-turk data (run online) are used in the analysis phase. Perspective: for Yourself.

## Study 2, for Yourself

comp 1 = Institutions \& Other
People
comp 2 = God
comp 3 = Nature
comp 4 = Yourself
comp 5 = Chance
eigenvalue comp $6=1.13$

## Remarks:

- The explained variances of the PCAs with 5 components are good: 70-75 percent.
- After rotation, the five components have a very clear interpretation: each component is interpreted as one actor, except for Human Institutions and Other People. The latter are found combined in one factor. This reflects the high correlations between these two actors and the low correlations between the other actors.
- The loadings of some components are less pronounced for item 7, which correlates the least with other items.
- The eigenvalues of the sixth components are around 1-1.5, while the eigenvalues of the fifth components are around 2.1-2.5. Hence, also the eigenvalue larger than 1 criterion indicates that we should include 5 (or 6 ) components for each PCA.

## Principal Component Analysis for both studies together, for the perspectives separately

Next, we combine both studies and do a PCA with Varimax rotation for each perspective separately. Below, the results are presented analogous to the above. Not surprisingly, the conclusions are the same as for the PCAs of the two studies separately.

| Component | Extraction Sums of Squared Loadings |  |  | Rotation Sums of Squared Loadings |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Total | \% of Variance | Cumulative \% | Total | \% of Variance | Cumulative \% |

## 3-way Candecomp/Parafac (CP) analysis per perspective

As an alternative to PCA per perspective as above, we can also fit the 3-way CP model to the $345 \times 7 \times 6$ arrays for each perspective. For more details on CP, see my previous report. The CP analysis is done such that the results can be compared to the PCAs above. In matrix notation, PCA per perspective can be written as $\mathbf{X} \approx \mathbf{A L}^{\mathrm{T}}$, where $\mathbf{X}$ is the $345 \times 42$ data matrix (rows are subjects, columns are items for one perspective), $\mathbf{A}$ is the $345 \times 5$ matrix with the component scores for the first five PCs, and $\mathbf{L}$ is the $42 \times 5$ matrix of loadings of the 42 items on the 5 PCs. Note that the columns of $\mathbf{X}$ are standardized in the PCAs above. When the columns of $\mathbf{X}$ are only centered, the results are analogous. The columns of $\mathbf{A}$ are orthogonal, as usual in PCA.

The Varimax rotation of the PCs can be written as $\mathbf{X} \approx \mathbf{A L}^{\mathrm{T}}=(\mathbf{A Q})(\mathbf{L} \mathbf{Q})^{\mathrm{T}}$, where $\mathbf{Q}$ is a $5 \times 5$ orthonormal rotation matrix. The Varimax algorithms finds $\mathbf{Q}$ such that the new loadings $\mathbf{L Q}$ have maximal variance of the squared loadings per column. This implies that (usually, hopefully) each column of $\mathbf{L Q}$ has a small number of large loadings and a lot of small ones, thus making interpretation of the PCs easier. As we have seen above, this works excellent in the PCAs per perspective.

In a 3-way CP analysis of $\mathbf{X}$ (with 5 components), the 42 items are explicitly considered as 6 groups of 7 items. The loadings $\mathbf{L}$ are written as $(\mathbf{B} \cdot \mathbf{C})$, with $\mathbf{B}$ a $7 \times 5$ matrix of loadings of the 7 items on the 5 components, and $\mathbf{C}$ a $6 \times 5$ matrix of loadings of the 6 actors on the 5 components. Formally, in 3-way CP the loading (i,r) of $\mathbf{L}$ is replaced by the product of loading ( $\mathrm{j}, \mathrm{r}$ ) of $\mathbf{B}$ multiplied by loading ( $\mathrm{k}, \mathrm{r}$ ) of $\mathbf{C}$, where item i ( of 42 in total) corresponds to item j (of 7 in total) and actor k . A 3-way CP solution ( $\mathbf{A}, \mathbf{B}, \mathbf{C}$ ) is unique (under some conditions, which hold in our case) and cannot be rotated as in PCA. It is interesting to see if the CP loadings for the actors in $\mathbf{B}$ are of the same well interpretable form as those in $\mathbf{L}$ in the PCAs above (for each of the 7 items separately).

The matrices $\mathbf{B}$ and $\mathbf{C}$ of the 3-way CP solutions per perspective are given in the table below. (Details: columns of X are centered (across mode A), no normalization, $\mathrm{R}=5$ components, orthogonality in mode $\mathrm{A}, 10$ runs with random starting values, ALS algorithm, convergence criterion 1e-9, scaling of $\mathbf{B}$ and $\mathbf{C}$ such that mean squared loading equals 1 per column.) The explained variance equals 75.44 percent for Others, and 76.81 percent for Yourself. As can be seen, the item loadings are around 1.00 with some smaller loadings for item 7. The actor loadings are not as nice as in the PCAs above. Some components are contrasts in terms of the actors (i.e., with both large positive and large negative actor loadings for the same component). Some components have large positive actor loadings for more than two actors. Note that Human Institutions and Other People tend to have similar loadings for each component. When comparing the CP solutions for the two perspectives, it can be seen that components 1 and 2 for Others are similar to components 2 and 1 for Yourself, respectively. Also, component 4 is similar in the two solutions.

For each perspective, we also constructed a 3-way CP solution from the corresponding PCA above. That is, we fit an approximation $\mathbf{L} \approx(\mathbf{B} \cdot \mathbf{C})$ to the PCA loading matrix $\mathbf{L}$. Here, matrix $\mathbf{B}$ has the same well interpretable form as in the PCA for each perspective. For these 3-way CP solutions, the explained variance equals 74.91 percent for Others and 76.28 percent for Yourself. Hence, in terms of fit, these 3-way CP solutions are very close to the ones obtained by fitting the 3-way CP model.

We tried to obtain these solutions by including constraints (nonnegativity, sparsity) in the actors mode of the 3 -way CP model, but this approach was not successful. (Idea: perhaps include the Varimax objective in the estimation of $\mathbf{B}$ ?)

## 4-way Candecomp/Parafac (CP) analysis on the complete dataset

Here, we consider the complete dataset of 84 items (both perspectives together). Doing a PCA (and Varimax rotation) on the $345 \times 84$ data matrix results in similar loadings as in the PCAs for the perspectives separately. Hence, we have $\mathbf{X} \approx \mathbf{A L}^{\mathrm{T}}$, where $\mathbf{X}$ is the $345 \times 84$ data matrix, $\mathbf{A}$ is the $345 \times 5$ matrix with the component scores for the first five PCs, and $\mathbf{L}$ is the $84 \times 5$ matrix of loadings of the 84 items on the 5 PCs. As in the PCAs above, each component has a clear interpretation in terms of the actors (each actor is represented by one component, and Human Institutions and Other People share a component; results not reported).

In a 4 -way CP analysis of $\mathbf{X}$ (with 5 components), the 84 items are explicitly considered as 6 groups of 7 items for 2 perspectives. The loadings $\mathbf{L}$ are written as $(\mathbf{B} \cdot \mathbf{C} \cdot \mathbf{D})$, with $\mathbf{B}$ a $7 \times 5$ matrix of loadings of the 7 items on the 5 components, $\mathbf{C}$ a $6 \times 5$ matrix of loadings of the 6 actors on the 5 components, and $\mathbf{D}$ a $2 \times 5$ matrix of loadings of the 2 perspectives on the 5 components. Formally, in 4 -way CP the loading ( $\mathrm{i}, \mathrm{r}$ ) of $\mathbf{L}$ is replaced by the product of loading ( $\mathrm{j}, \mathrm{r}$ ) of $\mathbf{B}$ multiplied by loading $(\mathrm{k}, \mathrm{r})$ of $\mathbf{C}$ multiplied by loading ( $1, \mathrm{r}$ ) of $\mathbf{D}$, where item i (of 84 in total) corresponds to item j (of 7 in total), actor $k$, and perspective 1. A 4-way CP solution ( $\mathbf{A}, \mathbf{B}, \mathbf{C}, \mathbf{D}$ ) is unique (under some conditions, which hold in our case) and cannot be rotated as in PCA. It is interesting to see if the CP loadings for the actors in $\mathbf{B}$ are of the same well interpretable form as those in $\mathbf{L}$ in the PCA on the 84 items (for each of the 7 items and each perspective separately).

The matrices $\mathbf{B}, \mathbf{C}$, and $\mathbf{D}$ of the 4 -way $\mathbf{C P}$ solution are given in the table below. (Details: columns of X are centered (across mode A), no normalization, $\mathrm{R}=5$ components, orthogonality in mode A, 10 runs with random starting values, ALS algorithm, convergence criterion 1e-9, scaling of $\mathbf{B}$ and $\mathbf{C}$ and $\mathbf{D}$ such that mean squared loading equals 1 per column.) The explained variance equals 69.31 percent. Components $1,2,4$ are similar to those found in the 3 -way CP solutions above. The item loadings are all around 1.00 except for a smaller loading for item 7 on component 4 . The actor loadings are not as nice as in the PCA, with components 3 and 5 being contrasts, and components 1 and 2 having large positive loadings of more than one actor (and not the pair Human Institutions and Other People).

We also constructed a 4-way CP solution from the PCA on all 84 items. That is, we fit an approximation $\mathbf{L} \approx(\mathbf{B} \cdot \mathbf{C} \cdot \mathbf{D})$ to the PCA loading matrix $\mathbf{L}$. Here, matrix $\mathbf{B}$ has the same well interpretable form as in the PCA. For this 4 -way CP solution, the explained variance equals 68.60 percent. Hence, in terms of fit, this 4 -way CP solution is very close to the one obtained by fitting the 4 -way CP model.
