

S2 Table. Quantitative trait loci, additive effects, and direction of phenotypic effect for plant height, panicle length, flag leaf length, flag leaf width, breaking tensile strength, germination % (arcsine transformed), grain length, grain width and thousand grain weight derived from the evaluation of the CSSLs and the recurrent parent (RP) Bengal. The presence of QTLs is inferred when there is significant difference between the means of each CSSL and the recurrent parent using the Dunnett's test. All CSSLs significantly different from the recurrent parent at  $p < 0.01$  are listed. This data was used to narrow down the QTL regions using substitution mapping. Direction of phenotypic effect (DPE) is denoted by B and R, which indicated Bengal and PSRR-1 allele increasing the trait values, respectively. In case of BTS and GermARS, reduced BTS and reduced germination % means increased seed shattering and seed dormancy.

<b>Plant Height (PH) (cm)</b>								
CSSL #	Mean	SE	p-value	Marker interval	Deviation from RP	Additive effect	Additive effect contribution(%)	DPE
1-8	130.5	1.53	<0.0001	RM8278-RM5362	25.4	12.7	16.7	R
4-1	127.2	5.54	<0.0001	RM335-RM5953	22.1	11.1	14.5	R
