

S2 Table. Number and location of breeding birds observed in regenerating stands ($n = 4$) and surrounding edge, 15 April – 15 July, 2012–2014, Glynn and Chatham counties, Georgia. Regenerating stands and treatments therein were bordered by drainage ditches (~1 m wide) containing vegetation which was unaffected by site preparation and thus more developed than vegetation in treatments. Locations in treatments included: Interior = ≥ 50 m from drainage ditches and adjacent forest edge (AFE); Moderate = 25-50 m from drainage ditches and AFE; and Short = 1-25 m from drainage ditches and AFE. A logging road (~3.7 m wide) separated each side of most regenerating stands and adjacent forest stands, which typically fell into two age classes: 1) young (~10 years old); and 2) mature (~30 years old).
