A 50.0% The information that you provide us will be used to value the grade of acceptance of a screening test.

Women often go to their doctor for a check for changes to the cells of the cervix that may lead to cervical cancer. This screening has halved the number of cases and death from cervical cancer.

There are now two new tests available:

The New Pap smear is better in picking up precancerous changes compared to the current smear. It will therefore detect more early changes that can be treated to prevent cervical cancer. You will still need a vaginal examination with a speculum like with the current smear.

The human papilloma virus (HPV) test is better in picking up precancerous changes compared to the current test. It will therefore detect more early changes that can be treated to prevent cervical cancer. You will still need a vaginal examination with a speculum like with the current test.

Would you rather have the HPV test or the New Pap smear when you visit your doctor?
