S1 Fig. *In vivo* detection of UNR protein in liver of mice infected with *Helicobacter hepaticus*. Images of mouse livers following a 12 months infection with *H. hepaticus*. Widefield image of 3 μm-tissue sections tissue sections of mice liver stained with fluorescent primary and secondary antibodies targeting UNR (green) and DAPI to counterstain the nucleus (blue). White arrowheads indicate UNR-NR. Tumoral areas are delineated by a discontinuous line. Enlargement of immunofluorescent staining are shown in boxes. DAPI, 4′, 6′-diamidino-2-phenylindol.
