Figure S4. Histology of infected murine brains

(A) Hematoxylin and eosin (H&E) stained brain sections were scored for meningoencephalomyelitis using a scale of 0 to 5 (n=4). p<0.05 WT vs Δcst1::cst1Δmuc
Figure S4. (B) Brains from mice infected with WT, Δcst1, Δcst1::cst1, or Δcst1::cst1Δmuc parasites for 4 weeks were sectioned and stained with H&E. Photomicrographs were obtained at 4X, 10X and 20X magnifications. Tissue cysts are indicated by a red arrow on 20X magnification images.
