Figure S4. Rifaximin (RFX) and sulfasalazine (SFZ) impacts the levels of inflammation during acute and early chronic SIVsab infection of pigtailed macaques (PTMs). Levels of proinflammatory cytokines were consistently lower in SIVsab-infected PTMs receiving RFX+SFZ (red) compared to untreated controls (black): TNF-α (a); I-TAC (b); and C-reactive protein (CRP) (c).
