S2 Figure. Relative expression levels of chitin synthase and chitin deacetylase genes.

Expression analysis was performed with all chitin synthase (chs) and chitin deacetylase (cda) genes by relating transcript levels of *sar1* (housekeeping), *chs1*-8 and *cda1*-6 to expression of the housekeeping gene *tef1* at 16 h of germination (white squares) or after 24 h of growth on PDA (white circles). Expression of all genes was further normalized to *tef1* using the normalization described by Pfaffl et al., [1]. qRT-PCR data was generated from at least two independent experiments and three technical replicates and analyzed with REST-software. Mean +/- SEM are indicated.
