

S7 Figure. The absence of 3'-UTR of *hilD* causes a severe upregulation of the secreted SPI-1 effector protein levels even in the absence of Gre factors. Cell-free supernatants of LB cultures of WT and $\Delta greA\Delta greB$ strains in both *hilD*3'UTR⁺ and *hilD*3'UTR⁻ genetic backgrounds. Cultures were grown at 37°C up to an OD_{600nm} of 2.0. Extracts were analyzed by Coomassie blue stained 12.5 % SDS-PAGE.
